This Abstract for College of Arts & Sciences is brought to you for free and open access by the Washington University

Senior Honors Thesis Abstracts at Washington University Open Scholarship. It has been accepted for inclusion in Spring 2018 by an authorized administrator of Washington University Open Scholarship. For more information, please contact [digital@wumail.wustl.edu](mailto:digital@wumail.wustl.edu).

PARTIAL KNOCKDOWN OF PUTATIVE *MTSA2* GENE  
SUPPORTS ITS ROLE IN 6mA ADENINE  
METHYLATION OF THE SOMATIC GENOME  
IN *TETRAHYMENA THERMOPHILA*

*Matthew Agritelley*

*Mentor: Douglas Chalker*

DNA methylation can confer heritable epigenetic information critical for proper reading of the genetic code. Methylation on the fifth carbon of cytosine (5mC) has been broadly studied for its roles in gene regulation and epigenetic inheritance. In contrast, much less is known about the importance of methylation on the sixth nitrogen of adenosines (6mA) in DNA or RNA. 6mA is the only DNA modification known in the model organism *Tetrahymena thermophila*, whose nuclear dimorphism provides a unique context for studying epigenetic regulation. In this ciliate, 6mA is found exclusively in the somatic nucleus, which may suggest that it participates in the control of gene expression. The enzyme(s) responsible for this modification remain undiscovered. Methyltransferase targeting position N-Six of Adenine 2 (*MTSA2*) is a putative gene in *T. thermophila* that belongs to a larger family of genes theorized to encode proteins that add 6mA to DNA or RNA. *MTSA2* contains a highly-conserved MT-A70 domain with known function as the S-adenosylmethionine binding subunit of mRNA methyltransferase in eukaryotic mRNA. We examined *MTSA2*'s function using a localization assay of a yellow fluorescent protein construct and assessed relative levels of 6mA by generating an *MTSA2* knockout (KO) strain. We found that *MTSA2* localizes to the macronucleus during growth, supporting its role as a DNA methyltransferase. Moreover, *MTSA2* KO strains showed a substantial decrease in 6mA relative to wild type (WT) strains. Interestingly, it was difficult to generate strains in which all of the copies of the *MTSA2* were knocked out in the polyploid (50N) somatic macronucleus. These KO strains appeared to grow more slowly than strains containing a greater number of WT copies. These results suggest that *MTSA2* appears to be important or even essential for cell growth. Together these data show that *MTSA2* likely functions as a key 6mA methyltransferase in *T. thermophila*.
