**INTRODUCTION**

What is the ideal structure for appellate review? Without providing a definitive answer to the question, commentators have suggested several factors that may improve the process, and thus perhaps the accuracy, of appellate review. First, it is said that panels of judges are preferable to review by a single judge. Second, expertise in the relevant area of law is a benefit. Third, other indicia of lawfinding ability—such as the ability of lawyers and judges to focus on legal issues without the distraction of factual conflicts and the amenability of judges’ schedules to careful contemplation and reflection—contribute to the quality of appellate review. Fourth, a court’s adherence to traditional notions of appellate hierarchy, as exemplified by following its earlier precedents, has been deemed to produce better results. Finally, it is said that the independence of appellate judges—that is, the extent to which job features such as life tenure and a guaranteed salary tend to insulate judges from pressures to decide cases or issues one way or another—is of value.

In this Article, we endeavor to evaluate empirically the relative quality of appellate review. To do this, we rely upon data obtained from the appellate review of bankruptcy matters. The current federal bankruptcy appellate structure provides an excellent setting in which to study appellate review because it offers litigants two paths for obtaining appellate review. First, after the bankruptcy judge issues a ruling, litigants may have the district court—in the person of a single district judge—review that ruling. Alternatively, the parties may agree (in circuits that have them) to have the bankruptcy judge’s
ruling reviewed by a panel of bankruptcy judges—a so-called “bankruptcy appellate panel” or “BAP.” Further appeal in both cases—whether from the district court or the bankruptcy appellate panel—lies with the proper federal circuit court of appeals.

We have collected data on affirmance rates in and citation rates to appellate bankruptcy opinions. Analyses of the data generally—and analyses of the citation data in particular—support the notion that BAP decisions in our study are perceived to be of greater quality than are district court decisions. First, we find support for the proposition that courts of appeals are more likely to uphold upon review the conclusions of BAPs than district courts. Second, BAP decisions are, with statistical significance, cited more frequently by bankruptcy courts, BAPs, federal courts of appeals, and courts in other circuits than are district court decisions. Only district courts are not more likely to cite BAP decisions than decisions rendered by district courts.

Our findings will be of interest both to theoreticians and policymakers. If courts try to reach “correct” decisions, then our findings generally buttress the various theories about how to structure appellate tribunals so as to maximize the quality of appellate review. This, in turn, should guide policymakers in designing appellate tribunals and appellate structures in general. In particular, multimember tribunals that adhere to traditional notions of appellate hierarchy and that have subject-matter expertise in the area of the appeal appear to be desirable. And, even if judges do not strive to resolve issues and cases “correctly,” our findings still seem to support the notion that judges perceive that appellate tribunals that have certain attributes will reach correct conclusions. In this sense, our findings show the persuasive strength of the theoreticians’ story, or at least judges’ perceptions of the strength of that story.

The Article proceeds in the following manner. Part I provides an overview of the theoretical literature discussing the quality of appellate review. Part II discusses the means by which we undertook to evaluate the quality of appellate review: Part II.A presents the legal setting of appeals of core bankruptcy proceedings, and Part II.B sets out the hypotheses we sought to test. Part III explains how we tested the hypotheses. Part III.A details the data we compiled and the essential features of those data. The next two subparts present the findings of our statistical analyses, with Part III.B explicating the bivariate descriptive statistics and Part III.C presenting the results of regression tests we conducted. Part III.D interprets these results and considers the implications of our findings.
I. EVALUATING THE QUALITY OF APPELLATE REVIEW

Assembling an exhaustive list of the ideal elements of appellate review would present no small task. However, the academic literature does suggest several attributes that will tend to contribute to better appellate review.

First, commentators laud the use of panels of judges, rather than single judges, to hear appeals. There are two justifications for this. First, to the extent that there is an objectively “correct” answer to a question of law posed on appeal, and to the extent that there is a greater than 50% chance that each appellate judge will reach that “correct” answer, the Condorcet Jury Theorem instructs that a panel of judges will more likely reach the “correct” answer than will a single appellate judge.1 Second, even to the extent that one might question the validity of the assumptions underlying the applicability of the Condorcet Jury Theorem in the context of appellate review,2 there is an argument that the collegial nature of multimember appellate panels contributes to reflective decisionmaking and thus to the quality of appellate review.3

A second factor that strengthens the quality of appellate review is expertise of the appellate decisionmaking body in the subject matter of the appeals it hears.4 Thus, for example, Congress created the United States Court of Appeals for the Federal Circuit with an eye to

4. See Erwin Chemerinsky, Decision-Makers: In Defense of Courts, 71 AM. BANKR. L.J. 109, 115 (1997) (“Specialization offers two major advantages: expertise and uniformity.”). For an argument that it might benefit the legal system to have some judges with expertise in areas other than law, see Adrian Vermeule, Should We Have Lay Justices?, 59 STAN. L. REV. 1569, 1587–88 (2007).
creating an appellate body with the expertise to deal effectively with the complex area of patent law.\(^5\)

Third, courts and commentators identify general “lawfinding ability”—as distinct from expertise in particular areas of law—as a virtue for appellate review.\(^6\) While the Supreme Court has characterized the presence of multijudge panels as “[p]erhaps most important” in assessing lawfinding ability,\(^7\) it has also indicated other factors that tend to enhance lawfinding ability in the appellate setting. Specifically, lawfinding ability is greater when (i) the judges have schedules that allow time for reflection,\(^8\) (ii) the judges resolve legal issues once the factual record is fully developed,\(^9\) and (iii) the attorneys may focus on the relevant legal issues without the distraction of trial advocacy.\(^10\)

A fourth factor that tends to be associated with the quality of appellate review is the extent to which an appellate court conforms to traditional appellate hierarchy.\(^11\) Courts in the United States are organized according to a standard hierarchy: trial courts decide cases in the first instance, with a first appeal as of right to an intermediate appellate court and a second appeal to a high court at the discretion of

\(^6\) See Nash, *supra* note 1, at 1022.

\(^8\) Id. at 231 (noting, with a negative connotation from the perspective of lawfinding ability, that district judges “preside alone over fast-paced trials”).

\(^9\) Id. at 232.

\(^10\) Id. at 231–32.

that high court. 12 Within that hierarchy are rules of precedent that, while not absolute, create barriers against courts overruling earlier cases. As a general matter, under so-called horizontal stare decisis, high courts and intermediate appellate courts will follow their own earlier precedents. 13 Further, vertical stare decisis binds inferior courts generally to the precedents issued by superior courts within the hierarchy. 14

It is true that court systems need not have the features of appellate hierarchy and stare decisis to function, nor indeed to function well. 15 Commentators debate whether Congress can statutorily alter or abrogate the traditional rules of stare decisis, as

---

13. Absent en banc review, courts of appeals are bound by prior decisions issued by the court (independent of panel composition). E.g., United States v. Myers, 200 F.3d 715, 720 (10th Cir. 2000).

In general, horizontal stare decisis does not extend beyond the court that issued an opinion to sibling courts of the same hierarchical level. While intermediate appellate courts will follow decisions issued by earlier panels of the same court—notwithstanding that the composition of the judges on the panels may vary—intermediate appellate courts generally are under no precedential obligation to follow decisions issued by sibling intermediate appellate courts of similar hierarchical rank. Thus, for example, a Ninth Circuit panel may find First Circuit precedent to be persuasive and choose to follow it, but stare decisis does not demand that the Ninth Circuit so act; rather, stare decisis leaves the Ninth Circuit free to disagree with and to disregard the First Circuit precedent. See, e.g., Evan H. Caminker, Why Must Inferior Courts Obey Superior Court Precedents?, 46 STAN. L. REV. 817, 824–25 (1994). Also, the rule of horizontal precedent does not extend to trial courts, as discussed below. See Amy Coney Barrett, Stare Decisis and Due Process, 74 U. COLO. L. REV. 1011, 1015 (2003); Caminker, supra, at 825 ("A district court judge may ignore the decisions of 'foreign' courts of appeals as well as other district court judges, even within the same district." (footnote omitted)); Kornhauser, supra note 12, at 1609. But see Daniel J. Bussel, Power, Authority, and Precedent in Interpreting the Bankruptcy Code, 41 UCLA L. REV. 1063, 1095 (1994) (noting a "long tradition" of district judges deviating from prior precedent in the same district only in extraordinary circumstances); infra note 71 and accompanying text.

14. See, e.g., Chemerinsky, supra note 4, at 111 ("[C]ourts generally issue written decisions that, when published, have precedential effect on future rulings involving different parties."); Susan B. Haire, Stefanie Lindquist & Donald R. Songer, Appellate Court Supervision in the Federal Judiciary: A Hierarchical Perspective, 37 LAW & SOC'Y REV. 143, 145 (2003) ("Appellate oversight in the lower tiers of the federal judicial hierarchy . . . provides a process through which circuit judges are expected to promote legal rules that will guide decision making in subsequent cases."); Kornhauser, supra note 12, at 1609.

15. For example, civil law systems do not rely upon as stringent a hierarchy, or upon rules of precedent as stringent. See, e.g., Caminker, supra note 13, at 826; Kornhauser, supra note 12, at 1608; Thomas Landmark, Interpreting Precedents: A Comparative Study, 46 AM. J. COMP. L. 211, 214 (1998) (reviewing INTERPRETIVE PRECEDENTS: A COMPARATIVE STUDY (D. Neil MacCormick & Robert S. Summers eds., 1997)) ("One of the classic differences between civil-law and common-law jurisdictions is that the former . . . do not recognize judicial precedent as an independent source of law." (footnote omitted)). For an exposition, and critique, of the necessity and desirability of stare decisis, see Caminker, supra note 13, at 865–67.
well as the normative question of whether it should. Nonetheless, whether it is constitutionally mandated or normatively desirable, the assumption underlying the dominant U.S. judicial structure is that horizontal and vertical stare decisis provide precedential power to decisions by appellate courts. Assuming that judges seek to arrive at correct outcomes, these standard rules of precedent presumably increase the quality of appellate review. It stands to reason that a court that knows that its opinions will bind itself, and possibly bind lower courts, will consider more carefully its reasoning before issuing judgments and opinions that announce new rules of law. Relatedly, a focus on cases that raise novel legal questions should allow appellate courts to conserve judicial resources, apply those resources in cases in which they are truly needed, and thus to reach correct answers more frequently.

17. See Kornhauser, supra note 12, at 1606 (taking as a baseline assumption in developing economic theory of stare decisis that “the ‘judicial team’ seeks to answer the expected number of ‘correct’ answers subject to its resource constraint”); cf. Owen M. Fiss, Objectivity and Interpretation, 34 STAN. L. REV. 739, 746–47 (1982) (discussing how judges belong to an “interpretive community” that subscribes to the rule of law).

Even if goals other than arriving at the correct outcome motivate judges, see, e.g., Erin O’Hara, Social Constraint or Implicit Collusion? Toward a Game Theoretic Analysis of Stare Decisis, 24 SETON HALL L. REV. 736, 738–42 (1993) (arguing that judges’ self-interest—including judges’ interest in expanding their influence—explains the development of horizontal stare decisis); infra notes 100–102 and accompanying text, the fact remains that, to the extent that the U.S. judicial system substantially relies on the traditional hierarchical form and rules, the extent to which a court comports with that norm will increase the perception that it is reaching correct decisions.

18. See Kornhauser, supra note 12, at 1623 (“In a completely decentralized system each judge would have to attend to the caseload of every other judge in order to identify appropriate cases for review; in a hierarchical system, only the appellate judges need have a systemic perspective on caseload.”); cf. id. at 1620 (noting that, absent horizontal precedent, “each judge is more likely to give each case intensive consideration” (emphasis added)); id. at 1624 (arguing in favor of “strict vertical precedent because the hierarchical structure creates a division of labor between levels of the hierarchy”); id. at 1625–27 (arguing in favor of horizontal precedent at the appellate, but not the trial, level).

19. See Kornhauser, supra note 12, at 1622–24; Caminker, supra note 13, at 839–43. Of course, a cost in such a system is that the first court may resolve the legal question incorrectly, and then bind future courts to that rule. See O’Hara, supra note 17, at 736 n.3 (identifying the “primary social cost of stare decisis” as “the entrenchment of bad decisions”); see also Lewis A.
A fifth factor that many commentators identify as an ingredient of judicial quality is judicial independence.\textsuperscript{20} It is said that judges who enjoy greater independence are less likely to be swayed by irrelevant, nonjudicial concerns. The American Founding Fathers subscribed to this view,\textsuperscript{21} and accordingly vested Article III judges with presumptive life tenure and the guarantee of nonreduction in salary.\textsuperscript{22}

II. INVESTIGATING APPELLATE STRUCTURE AND THE PERCEIVED QUALITY OF APPELLATE REVIEW

At its essence, an appeal involves a claim that a trial court committed some form of error—for example, failure to follow proper procedure or improper application of the law. Accordingly, we might say that one of the primary functions of an appellate court, if not the principal function, is to ascertain whether the alleged error truly occurred. As we have already discussed, theorists have posited various attributes that improve the quality of appellate review. While plausible that some of these factors may contribute more than others to improving the quality of appellate review, it seems reasonable to conclude that, on balance, as between two different appellate tribunals, the one that has more of the theorized features of quality appellate review will perform the appellate function better.

Kornhauser, \textit{An Economic Perspective on Stare Decisis}, 65 CHI.-KENT L. REV. 63, 67–73 (1989) (discussing reliance by a court on earlier decisions by that court, even if wrongly decided, as an optimization problem and as varying depending upon institutional structure).

There are other social benefits that rules of stare decisis provide—certainty, predictability, fairness, and consistency. \textit{See} Caminker, \textit{supra} note 13, at 843–56 (discussing the desire to avoid “delayed justice,” the greater decisionmaking proficiency of superior courts, and uniform interpretation and application of law as consequentialist justifications for stare decisis); Kornhauser, \textit{supra} note 12, at 74–78 (discussing fairness, competence, and certainty as justifications for stare decisis). These benefits, however, are not the result of the courts necessarily reaching correct conclusions. Indeed, these benefits would inhere if courts uniformly reached bad decisions. \textit{See} Kornhauser & Sager, \textit{supra} note 3, at 105 (contrasting consistency, soundness, and coherence).

The two-tiered system of bankruptcy appeals is an excellent field for an empirical investigation of how alternative appellate structures may affect the quality of appellate review. The current appellate structure provides for appeals of bankruptcy court decisions in “core” bankruptcy proceedings to be heard by one of two appellate tribunals: federal district courts or federal bankruptcy appellate panels (commonly referred to as “BAPs”). Based on the criteria we identified above in Part I, we conclude that the BAP is the stronger of the two appellate courts—that is, better equipped to carry out the principal function of identifying alleged error. We investigate this hypothesis through the study of appeals in core bankruptcy proceedings. We seek to unearth evidence that will inform scholarly inquiry into the hallmarks of quality appellate review and that will illuminate areas warranting further exploration.

This Part sets the backdrop for our empirical study. First, we describe the bankruptcy judicial structure, with primary emphasis on the manner in which appeals progress through it. We then discuss our approach for empirically investigating the theoretical proposition that BAPs are the stronger of the two appellate courts in performing appellate function at the first tier of review. We finally develop a series of hypotheses to test the theory.

A. The Bankruptcy Appellate Process

Unlike any other part of the federal judicial system, the bankruptcy appeals process routinely involves two levels of intermediate review. This anomalous state of affairs can be traced to congressional reform efforts during the 1970s that sought to improve the quality of the bankruptcy court while simultaneously maintaining it in a subordinate relationship to the district court.23

Under the predecessor to the current Bankruptcy Code, the Bankruptcy Act of 1898,24 district courts delegated much of their responsibility over bankruptcy cases to “bankruptcy referees,” individuals appointed by a panel of district judges for a six-year term.25 The limited role and status of the referees at the inception of the Bankruptcy Act expanded over time, which in turn increased the cadre of full-time judicial officers involved in the administration of

bankruptcy cases. Eventually, the Supreme Court promulgated rules of bankruptcy procedure in 1973 that redesignated referees as “bankruptcy judges.” This change, however, did not remove the distinction between bankruptcy judges and Article III judges, including, for example, “prohibitions against bankruptcy judges using the elevators, parking lots, and dining rooms reserved for Article III judges.” Moreover, some Article III judges continued to refer to bankruptcy judges as “referees” in spite of the titular change. Sentiments such as these infused their way into the policymaking debates over bankruptcy reform in the 1970s.

In 1970, Congress established the Commission on the Bankruptcy Laws of the United States to analyze the Bankruptcy Act and to suggest recommendations for its reform. While the original resolution creating the Commission proposed that the Chief Justice would appoint two bankruptcy referees as commissioners, strident opposition—led by, among others, District Judge Edward Weinfeld, chair of the Judicial Conference’s Committee on the Administration of the Bankruptcy System—resulted in passage of the resolution without constraints on whom the Chief Justice could appoint. The Chief Justice did not appoint any bankruptcy referees to the Commission, instead appointing Judge Weinfeld and District Judge Hubert Will. Judge Weinfeld’s efforts resulted in the exclusion of bankruptcy referees from policymaking discussions on bankruptcy reform within the organizational framework of both the Commission and the Judicial Conference. That the federal judiciary went to great lengths to oppose the inclusion of bankruptcy referees in the reform process highly suggests that Article III judges feared loss of power and prestige in the event Congress increased the power of bankruptcy

28. Vern Countryman, Scrambling to Define Bankruptcy Jurisdiction: The Chief Justice, the Judicial Conference, and the Legislative Process, 22 HARV. J. ON LEGIS. 1, 2 (1985). Hearsay evidence suggests that at least one Article III judge viewed bankruptcy judges as occupying the professional status equivalent to a janitor. See Mund, supra note 26, at 12 n.34.

29. Posner, supra note 23, at 61 & n.25; cf. Mund, supra note 26, at 12 n.34 (“As late as 1978, even though Judge James Browning, then chief judge of the Ninth Circuit, specifically invited five bankruptcy judges to attend the circuit conference, Senior District Judge Lloyd George (formerly a bankruptcy judge) reports that ‘they wouldn’t call me “judge.” They called me mister.’” (quoting Interview with Lloyd George (Dec. 20, 2004))).

32. Id. at 8.

33. Id.
It is this dynamic that underlies the current bankruptcy judicial structure and the anomaly of double appeals. Only one level of intermediate appellate review would have been needed had Congress made today’s bankruptcy judges coequals with district court judges, but that was not to be the case.

With enactment of the Bankruptcy Code in 1978, Congress effectuated a complete overhaul of the federal bankruptcy system that had been in place for eighty years. While there were proposals to vest bankruptcy judges with Article III status, Congress ultimately rejected that notion, a decision supported by most current and former Article III judges. Congress instead decided to establish the bankruptcy courts as “adjuncts” of the federal district courts. Bankruptcy jurisdiction was vested statutorily in the district courts, yet the statute also directed that all of that jurisdiction was to be exercised by the bankruptcy courts, which were to be staffed by non-Article III judges.

The Supreme Court rejected the 1978 Act’s jurisdictional structure in Northern Pipeline Construction Co. v. Marathon Pipe Line Co. The Court in Marathon held that the 1978 Act violated Article III by vesting federal judicial power in non-Article III bankruptcy judges. The decision forced Congress to repair the constitutional infirmity. Lobbying by Article III judges led Congress yet again to reject a solution of affording bankruptcy judges Article III status. Instead, Congress simply modified the 1978 structure. The Bankruptcy Amendments and Federal Judgeship Act of 1984

---

34. See Posner, supra note 23, at 75.
37. See id. at 8–9; Posner, supra note 23, at 77 (“The federal judges opposed the creation of more independent bankruptcy courts, because (1) they would lose their appointment power over bankruptcy judges, and thus one of their main patronage opportunities, and (2) their status would be diluted through the vast increase in the number of federal judicial positions.”).

Interestingly, as Congress considered various proposals for reorganizing the court structure of the bankruptcy system in its reform efforts from the 1970s that led to enactment of the Bankruptcy Code, bankruptcy judges did not seek Article III status. Instead, they lobbied Congress for appointment by the judicial council, rather than the president, for two reasons: First, they believed their merit would be properly recognized in a nonpolitical judicial appointment process; and, second, they feared that sitting judges would lack the political connections necessary for presidential appointment. See Mund, supra note 26, at 20–21, 24–25, 29. For a political economic analysis of the 1978 Act’s treatment of bankruptcy judges, see Posner, supra note 23, at 74–94.
39. 458 U.S. at 87.
statutorily established the bankruptcy judges, who are appointed by the courts of appeals,\textsuperscript{41} as “unit[s]” of the district courts.\textsuperscript{42} Thus, parties technically should file bankruptcy cases in federal district court. However, the Act authorizes each district court to “refer” “any or all cases” or “proceedings” to the bankruptcy judges.\textsuperscript{43} District courts in turn have implemented “standing orders” to refer bankruptcy cases in the first instance to the bankruptcy courts.\textsuperscript{44}

In determining the scope of the bankruptcy judge’s authority to resolve a dispute within a bankruptcy case,\textsuperscript{45} it is necessary to categorize the proceeding as core or non-core. Absent the consent of all parties, bankruptcy judges may only issue recommendations for the resolution of non-core proceedings, with de novo district court review upon objection by either party.\textsuperscript{46} Appellate review thereafter lies to the appropriate federal court of appeals,\textsuperscript{47} and thence to the Supreme Court,\textsuperscript{48} in line with the typical federal appellate hierarchy.

Core proceedings, on the other hand, are those that lie at the heart of a bankruptcy case.\textsuperscript{49} Bankruptcy judges are empowered to

\begin{footnotesize}
\begin{enumerate}
\item Id. § 151 (2000); see also id. § 152(a)(1) (Supp. V 2005) (“Bankruptcy judges shall serve as judicial officers of the United States district court established under Article III of the Constitution.”).
\item Id. § 157(a) (2000).
\item 9 A.M. JUR. 2D Bankruptcy § 731 (2008); Bussel, supra note 13, at 1066 & n.12.
\item Disputes in bankruptcy cases generally assume one of two forms: (1) an adversary proceeding, or (2) a contested matter. Adversary proceedings include, for example, a proceeding to recover money or property; a proceeding to determine the validity, priority, or extent of a lien; a proceeding to object to or revoke a discharge; and a proceeding to determine the dischargeability of a debt. Fed. R. Bankr. P. 7001. Such proceedings are initiated and advance much as any other federal lawsuit, insofar as Part VII of the Federal Rules of Bankruptcy Procedure, which governs such proceedings, virtually incorporates the Federal Rules of Civil Procedure (occasionally with modification). See, e.g., id. 7003 (Fed. R. Civ. P. 3); id. 7004(a) (portions of Fed. R. Civ. P. 4); id. 7005 (Fed. R. Civ. P. 5); id. 7012(b) (Fed. R. Civ. P. 12(b)–(h)); id. 7013 (Fed. R. Civ. P. 13); id. 7014 (Fed. R. Civ. P. 14); id. 7056 (Fed. R. Civ. P. 56). Disputes between parties that are not adversary proceedings are called “contested matters,” and they proceed according to less complex procedures than adversary proceedings—including request for relief by motion rather than the filing of a complaint. Fed. R. Bankr. P. 9014; see also Khachikyan v. Hahn (In re Khachikyan), 335 B.R. 121, 125 (B.A.P. 9th Cir. 2005) (“In a contested matter, there is no summons and complaint, pleading rules are relaxed, counterclaims and third-party practice do not apply, and much pre-trial procedure is either foreshortened or dispensed with in the interest of time . . . .”).
\item Id. § 1254(1).
\item Section 157(b)(1) of the Judicial Code speaks of “core proceedings arising under title 11, or arising in a case under title 11.” Id. § 157(b)(1). In turn, section 157(b)(2) lists examples of core proceedings, which include matters concerning (1) administration of the estate, (2) the allowance
\end{enumerate}
\end{footnotesize}
resolve these cases definitively, in the first instance, with appellate review to follow.\textsuperscript{50} Here, however, there may be more than one possible appellate path.

The statute authorizes the judicial council of each circuit to establish a “bankruptcy appellate panel”—commonly known as a “BAP”—comprised of bankruptcy judges from that circuit.\textsuperscript{51} BAPs are now constituted—and have been constituted since 1996—in the First, Sixth, Eighth, Ninth, and Tenth Circuits.\textsuperscript{52} For a BAP to be empowered to hear appeals from bankruptcy courts in a given district, a majority of district judges in the district must vote to authorize it.\textsuperscript{53} In circuits that have created BAPs and in districts that have authorized the BAP to hear appeals, the default rule is that, unless a party elects otherwise, appeals of bankruptcy judges’ rulings in core proceedings will lie to the BAP.\textsuperscript{54} Appeals from BAP rulings lie to the

\textsuperscript{50} Id. § 157(b)(1) (2000). Unless, that is, the district court withdraws the reference to the bankruptcy court. Id. § 157(d). In that case, the district court hears the matter in the first instance, with appeals in the ordinary course lying to the court of appeals and then the Supreme Court. See supra notes 47–48.

\textsuperscript{51} 28 U.S.C. § 158(b)(1). The statute also authorizes the creation of intercircuit BAPs, id. § 158(b)(4), but none has yet been created. Much as the bankruptcy court is a unit of the district court, the bankruptcy appellate panel may be seen as “a unit of the federal courts of appeals.” Admin. Office of the U.S. Courts, The Federal Judiciary—United States Courts of Appeals, Bankruptcy Appellate Panels, http://www.uscourts.gov/courtsofappeals/bap.html (last visited Oct. 11, 2008); see also 28 U.S.C. § 158(b)(1) (requiring BAPs to be established and BAP judges to be appointed by the circuit judicial council); B.A.P. 8TH CIR. R. 8016A(a)(1) (“The Clerk of the United States Court of Appeals for the Eighth Circuit shall serve as the Clerk of the United States Bankruptcy Appellate Panel for the Eighth Circuit.”). Compare Coyne v. Westinghouse Credit Corp. (In re Globe Illumination Co.), 149 B.R. 614, 620–21 (Bankr. C.D. Cal. 1993) (describing BAP as unit of the circuit court), with Kathleen P. March & Rigoberto V. Obregon, Are BAP Decisions Binding on Any Court?, 18 CAL. BANKR. J. 189, 197 (1990) (describing BAP as unit of the district court).

\textsuperscript{52} The 1994 amendments to the Bankruptcy Code were designed to encourage circuit courts to create BAPs by directing that each circuit “shall establish” a BAP unless the circuit judicial council finds that existing judicial resources are insufficient to establish one or that its establishment would result in undue delay or increased cost to parties in cases under the Bankruptcy Code. 28 U.S.C. § 158(b)(1). The six regional circuits that voted against establishing BAPs “concluded that the appellate process was functioning well as already constituted and that BAPs would create undue delay or increase the cost of appeals.” Henry J. Boroff, The Precedential Effect of Bankruptcy Appellate Panel Decisions, 103 COM. L.J. 212, 214 n.10 (1998) (citing Elizabeth Abbott, Bankruptcy Review Panel Makes Debut, NAT’L L.J., Mar. 3, 1997, at B1). For a historical discussion of BAPs, see Bryan T. Camp, Bound by the BAP: The Stare Decisis Effects of BAP Decisions, 34 SAN DIEGO L. REV. 1643, 1648–60 (1997); infra note 75.

\textsuperscript{53} 28 U.S.C. § 158(b)(6). In the mid-1990s, when a Second Circuit BAP was in existence, “only three districts participate[ed]—and these together typically receive[d] less than a third of all bankruptcy petitions filed in the Second Circuit.” Camp, supra note 52, at 1660. These facts, presumably, played a large role in the ultimate decision to disband the Second Circuit BAP.

circuit courts of appeals. Parties may seek discretionary review by the Supreme Court of rulings by the courts of appeals.

If either the appellant or the appellee so elects—or if the circuit has not created a BAP or, even if it has, if the district court in question has not voted to authorize BAP appeals—then the district court (in the person of a single district judge) initially hears appeals of bankruptcy court rulings in core proceedings. The judgment of the district court may then be appealed to the appropriate circuit court of appeals, with discretionary Supreme Court review as the remaining appellate step. In short, then, certain parties in some circuits have an option between two possible appellate paths. We illustrate this in Figure 1.

56. Id. § 1254(1) (2000).
59. Id. § 1254(1) (2000).
60. See generally Bernard Trujillo, Self-Organizing Legal Systems: Precedent and Variation in Bankruptcy, 2004 UTAH L. REV. 483, 490–500 (elucidating the differences between the standard federal judicial hierarchy and the bankruptcy appellate system).
61. We should note that a third possible appellate path not yet discussed—that of direct appeal from the bankruptcy court to the court of appeals—exists for a limited set of circumstances. By virtue of amendment to the Judicial Code by the Bankruptcy Abuse Prevention and Consumer Protection Act of 2005, Pub. L. No. 109-8, 119 Stat. 23, appeal may proceed directly to the court of appeals pursuant to a certification procedure if one of the following circumstances exists: (1) the appeal involves a question of law unresolved by the court of appeals for the circuit or by the Supreme Court; (2) the appeal involves a matter of public importance; (3) the appeal involves a question of law requiring resolution of conflicting decisions; or (4) the appeal may materially advance the progress of the case or proceeding in which the appeal is taken. 28 U.S.C. § 158(d)(2)(A) (Supp. V 2005).
A comparison of BAPs to district courts suggests that BAPs have more of the features of quality appellate review than do the district courts. First, bankruptcy appellate panels are collegial bodies that decide cases in three-judge panels. Indeed, bankruptcy judges who serve on BAPs themselves believe that reviewing cases in panels of judges benefits decisionmaking. By contrast, bankruptcy appeals to district courts are heard by a single district judge.

Second, the bankruptcy judges who comprise bankruptcy appellate panels are (by virtue of their appointment as bankruptcy

judges) presumably experts in bankruptcy law. Thus, they are well suited to resolve legal issues that might arise in core bankruptcy proceedings. District judges, by contrast, are more often characterized as generalists in the law, without special training or experience in bankruptcy law.

The third factor—“other” lawfinding ability—appears to favor neither district judges nor bankruptcy appellate panels. Attorneys filing appellate briefs may focus on the legal issues without the distractions of trial advocacy, whether the briefs are filed with the district court or appellate panel. Similarly, both district judges and bankruptcy appellate panels hear legal issues once a factual record has been established. Last, while district judges and bankruptcy judges both preside over trials, neither the district judge hearing a bankruptcy appeal, nor bankruptcy judges sitting on a bankruptcy appellate panel, are presiding over a trial as part of the appellate process.

---

63. See, e.g., id. at 107 (“Most of the bankruptcy judges were bankruptcy practitioners in their prior careers.”); see also id. at 123 (noting that, of a random survey of bankruptcy judges in 2005, “[a]bout 83% . . . were bankruptcy practitioners before taking the bankruptcy bench,” and that, “[i]f the 17% . . . who were not bankruptcy practitioners, almost all came from a business law background, as commercial litigators or corporate transactional lawyers,” and further noting that the surveyed bankruptcy judges felt that their prior experience was very helpful on the bench); cf. id. at 113–16 (discussing the trend among bankruptcy judges to hire more permanent, as opposed to term, law clerks, and noting that those bankruptcy judges who preferred permanent clerks often hired clerks with legal experience, and in particular practice experience in bankruptcy law).

64. See Chemerinsky, supra note 4, at 128 (“[T]he BAP is desirable because it allows specialist bankruptcy judges to replace nonspecialist federal district court judges.”); see also Jeffrey J. Rachlinski, Chris Guthrie & Andrew J. Wistrich, Inside the Bankruptcy Judge’s Mind, 86 B.U. L. Rev. 1227, 1230–31 (2006) (reporting empirical finding that bankruptcy judges as specialized actors perform “at least as well” as generalist judges in terms of not exhibiting typical biases often reflected in judgments).

65. One might argue that even district judges with no experience in bankruptcy before ascending to the bench gain some experience by virtue of hearing a steady stream of bankruptcy cases. A study by the Federal Judicial Center of the bankruptcy appellate structure, however, reached the opposite conclusion, observing that “[t]he number of first-level reviewers greatly exceeds the number of bankruptcy judges producing the judgments reviewed, and appellate caseloads are spread thinly among district judges, giving few judges much opportunity to develop bankruptcy expertise.” Judith A. McKenna & Elizabeth C. Wiggins, Alternative Structures for Bankruptcy Appeals, 76 Am. Bankr. L.J. 625, 627 (2002).

66. We employ the modifier “other” because, as noted above, the Court suggested that the use of multi-judge panels is “[p]erhaps most important” in assessing lawfinding ability. Supra note 7 and accompanying text.

67. It is this factor that, presumably, vests district judges with lawfinding ability when they sit by designation on court of appeals panels. See Nash, supra note 1, at 1031 (explaining that the better term is lawfinding “ability” and not lawfinding “expertise”). One might argue that lawfinding ability is enhanced to the extent that the judge (whether district or bankruptcy) enjoys relief from her other responsibilities while hearing appeals. This seems not to be the case, however, at least for bankruptcy judges:
Fourth, bankruptcy appellate panels conform to traditional notions of appellate review: their rulings are generally seen to be binding on future bankruptcy appellate panels drawn from the same circuit. Further, at least one BAP has held that its decisions are binding on all bankruptcy courts within that circuit, even if the bankruptcy courts themselves do not share this view. In contrast,

When asked how BAP service affects their service as a bankruptcy judge, several of the surveyed bankruptcy judges indicated that it required adjustments to their bankruptcy court trial and hearing schedule and that it substantially added to their workload. Some of the Survey Participants suggested that those bankruptcy judges who serve full-time on the BAP should have the option of employing an additional law clerk. One Survey Participant indicated that service on the BAP was “like having a second job.”

Mabey, supra note 62, at 122 (footnote omitted); see also Stephen A. Stripp, An Analysis of the Role of the Bankruptcy Judge and the Use of Judicial Time, 23 SETON HALL L. REV. 1329, 1330 (1993) (“The fundamental truth which is the basis for this article is that the bankruptcy caseload in many districts in this country is so overwhelming that the bankruptcy judges are sorely pressed in the struggle to cope with it.”).

68. BAPs in three circuits—the Eighth, Ninth, and Tenth—have reached this conclusion. E.g., Concannon v. Imperial Cap. Bank (In re Concannon), 338 B.R. 90, 95 (B.A.P. 9th Cir. 2006) (reaffirming that the BAP will not overrule its prior rulings unless an intervening circuit court or Supreme Court decision, or subsequent legislation, undermines those rulings); Salomon N. Am. v. Knupfer (In re Wind N’ Wave), 328 B.R. 176, 181 (B.A.P. 9th Cir. 2005) (same); Blagg v. Miller (In re Blagg), 223 B.R. 795, 804 (B.A.P. 10th Cir. 1998) (“Our decision is dictated by the principle that we are bound by prior panel decisions. A panel cannot overrule the judgment of another panel of the court.”), appeal dismissed, 198 F.3d 257 (10th Cir. 1999); Smolen v. Hatley (In re Hatley), 227 B.R. 757, 761 (B.A.P. 10th Cir. 1998) (same), aff’d, 194 F.3d 1320 (10th Cir. 1999); Luedtke v. Nationsbanc Mortgage Co. (In re Luedtke), 215 B.R. 390, 391 (B.A.P. 8th Cir. 1997) (relying on circuit court precedent that circuit court panel decisions bind subsequent circuit court panels to announce rule that BAP decisions bind subsequent BAP panels); Ball v. Payco-Gen. Am. Credits, Inc. (In re Ball), 185 B.R. 595, 597 (B.A.P. 9th Cir. 1995) (“We will not overrule our prior rulings unless a Ninth Circuit Court of Appeals decision, Supreme Court decision or subsequent legislation has undermined those rulings.”).

69. Philadelphia Life Ins. Co. v. Proudfoot (In re Proudfoot), 144 B.R. 876, 879 (B.A.P. 9th Cir. 1992) (“[B]AP decisions originating in any district in the Ninth Circuit are binding precedent on all bankruptcy courts within the Ninth Circuit in the absence of contrary authority from the district court for the district in which the bankruptcy court sits.”); In re Windmill Farms, Inc., 70 B.R. 618, 622 (B.A.P. 9th Cir. 1987), rev’d on other grounds, 841 F.2d 1467 (9th Cir. 1988).

70. Compare, e.g., Ore. Higher Educ. Assistance Found. v. Selden (In re Selden), 121 B.R. 59, 62 (D. Ore. 1990) (stating that BAP decisions bind only those bankruptcy courts sitting in the district out of which the appeal arose), with Daly v. Deptula (In re Carrozella & Richardson), 255 B.R. 267, 273 (Bankr. D. Conn. 2000) (rejecting argument that substantial motivation of Congress in creating BAPs was to generate a uniform body of bankruptcy law within the circuits, concluding that there is no principled reason why decisions of a BAP should have more precedential authority than those of district courts, and finding it odd and unseemly, if not unconstitutional, for a BAP—comprised of three non-Article III judges—to be generating for bankruptcy judges, and perhaps also for district judges, the law of the circuit until the circuit court had spoken), In re Virden, 279 B.R. 401, 409 n.12 (Bankr. D. Mass. 2002) (quoting In re Carrozella, 255 B.R. at 272-73), and Life Ins. Co. of Va. v. Barakat (In re Barakat), 173 B.R. 672, 676–80 (Bankr. C.D. Cal. 1994) (concluding that BAP’s bind bankruptcy courts on matters arising in core proceedings even though district courts do not), aff’d on other grounds, 99 F.3d 1520 (9th Cir. 1996). For further discussion regarding the precedential effect of BAP decisions,
one district judge is generally not bound to follow the ruling of another
district judge—even one in the same district—on matters of
bankruptcy or otherwise.71 And bankruptcy courts have held that they
are not bound by the holding of a single district judge on a multijudge
district court.72 Therefore, BAPs comport more with the standard
model of appellate hierarchy than do district courts hearing
bankruptcy appeals.73

71. See Salomon N. Am., 328 B.R. at 181 n.2 (noting the Ninth Circuit BAP’s prior holding that its
decisions bind bankruptcy courts within the circuit, but also recognizing that some bankruptcy
courts have rejected that holding); Zimmer v. PSB Lending Corp. (In re Zimmer), 313 F.3d 1220,
1225 n.3 (9th Cir. 2002) (describing “binding nature of Bankruptcy Appellate Panel decisions” as
“an open question,” and “join[ing] Judge O’Scannlain’s call for the [Ninth Circuit] Judicial
Council to consider an order clarifying whether the bankruptcy courts must follow the BAP”);
Bank of Maui v. Estate Analysis, Inc., 904 F.2d 470, 472 (9th Cir. 1989) (“BAP decisions cannot
bind the district courts themselves. As article III courts, the district courts must always be free
to decline to follow BAP decisions and to formulate their own rules within their jurisdiction.”); id.
at 472 (O’Scannlain, J., concurring) (writing “separately to propose that the Judicial Council of
this Circuit consider adoption of an order requiring that Bankruptcy Appellate Panel . . .
decisions shall bind all of the bankruptcy courts of the circuit, subject to the restrictions imposed
by article III so well discussed in the [court’s] opinion”); Paul M. Baisier & David G. Epstein,
Resolving Still Unresolved Issues of Bankruptcy Law: A Fence or an Ambulance, 69 AM. BANKR.
L.J. 525, 531 (1995) (“Even stronger arguments can be made against any stare decisis effect at all
for the opinion of a bankruptcy appellate panel.”); Chemerinsky, supra note 4, at 129–30 (“I
would argue that district courts should be bound by BAP decisions. The view that an Article I
court can never bind an Article III court is an overstatement.”); Trujillo, supra note 60, at 494
n.23 (arguing that BAPs function as district courts, and accordingly cannot issue binding
opinions).

72. See e.g., In re Romano, 350 B.R. 276, 281 (Bankr. E.D. La. 2005) (“[A] single decision of
a district court in this multi-judge district is not binding upon this court.”); id. at 277–81
(summarizing authority for both sides); Paul Steven Singerman & Paul A. Avron, Of Precedents
and Bankruptcy Court Independence, 22 AM. BANKR. INST. J. 1, 56–57 (2003) (noting conflict,
gathering authorities, and finding that a majority of bankruptcy courts have held that they are
not bound by the decision of a single district court judge in a multi-judge district); Trujillo, supra
note 60, at 494 (arguing that a bankruptcy decision by one bankruptcy judge cannot bind other
bankruptcy judges in the same district, and that a bankruptcy decision by one district judge
cannot bind other district judges or bankruptcy judges in the same district). But see
Chemerinsky, supra note 4, at 129 (“While a district court exercising original jurisdiction cannot
bind other district courts, its decisions should be binding on bankruptcy courts when the district
court is serving as an appeals court.”).

73. Our point here is simply that BAPs seem to fit more cleanly into the standard
hierarchical appellate model than do district courts sitting on appeal, not that that is necessarily
mandated under the current statutory scheme or normatively desirable. The latter two points
are debatable.

With respect to the current statutory scheme, there are statements in the legislative history
indicating that Congress created the BAPs to help foster greater uniformity in bankruptcy law.
See, e.g., 140 Cong. Rec. S14,463 (daily ed. Oct. 6, 1994) (statement of Sen. Heflin) (“It should be recognized that the creation of a bankruptcy appellate panel service can help to establish a dependable body of bankruptcy case law.”). But see Daly, 255 B.R. at 273:

Any suggestion that Congress’ authorization of the creation of BAP Services was motivated substantially by its desire to create a uniform body of bankruptcy law within the circuits is not supported by the BAP Service’s history, which instead suggests that BAPs were conceived primarily as a tool for relieving district court judges of oftentimes undesirable and burdensome aspect of their workload.

At the same time, one can point to the certification procedure in section 158(d)(2) of the Judicial Code—under which courts of appeals may decide interlocutory appeals when, among other circumstances, the question raised is one “as to which there is no controlling decision of the court of appeals or of the Supreme Court of the United States,” 28 U.S.C. § 158(d)(2)(A)(i) (Supp. V 2005)—as evidence that Congress chose other, explicit means of increasing bankruptcy law uniformity. See H.R. Rep. No. 109-31, at 148 (2005), reprinted in 2005 U.S.C.C.A.N. 88, 206.

Commentators are divided over whether BAP decisions bind bankruptcy courts. Compare, e.g., Bussel, supra note 13, at 1098 (arguing that bankruptcy courts should consider both BAP and district court decisions as binding precedent), Chemerinsky, supra note 4, at 128 (“From [a] functional perspective, I think that BAP decisions clearly should be binding on bankruptcy courts.”), and Camp, supra note 52, at 1676–84 (arguing that BAPs should bind both bankruptcy and district courts within a circuit), with Trujillo, supra note 60, at 492 (“[O]nly opinions of the U.S. courts of appeals and the U.S. Supreme Court bind bankruptcy courts by reason of formal hierarchy.”), and Caminker, supra note 13, at 870–72 (arguing that theoretical considerations argue in favor of bankruptcy courts being bound by district court decisions). Moreover, strict application of vertical stare decisis is difficult, insofar as it is not certain until after the bankruptcy court has issued judgment into which appellate path the case will proceed. Cf. Camp, supra note 52, at 1682:

Since bankruptcy judges do not know at the time they make a decision whether it will be a BAP or a district court that will hear any appeal, and since no district court has so far considered itself bound by a BAP, it is no surprise that many bankruptcy judges feel free to disregard BAP decisions.

Compare this to the United States Tax Court, which considers itself bound by its own precedent, except insofar as it has also held that it is bound “to follow a Court of Appeals decision which is squarely in point where appeal from [the] decision lies to that Court of Appeals.” Golson v. Comm’r, 54 T.C. 742, 756–57 (1970), aff’d, 445 F.2d 985 (10th Cir. 1971). Because the court of appeals to which a taxpayer will appeal is determined by his state of residence, 26 U.S.C. § 7482(b)(1) (2000), it is always clear at the time of decision which circuit’s precedent is binding.

As to the normative question, there are those who argue that an increase in application of stare decisis would be normatively desirable. See, e.g., Boroff, supra note 52, at 215, 221 (arguing that the current dual track appellate system makes it difficult to generate binding precedent, and that the system be changed to allow for development of binding precedent); Bussel, supra note 13, at 1095 n.114 (“Logically . . . district courts . . . as well as bankruptcy courts might be bound by prior BAP decisions.”). There also are strong arguments, however, that a structure other than the standard appellate hierarchy might be desirable. First, one of the bases on which the pyramidal appellate hierarchy functions is the notion that issues “percolate” up from the lower courts to the higher courts. It is the desire for percolation that, commentators argue, restricts (and properly so) application of horizontal stare decisis to the same court and not to sibling courts of equal hierarchical stature. See Samuel Estreicher & Richard L. Revesz, The Uneasy Case Against Intracircuit Nonacquiescence: A Reply, 89 Yale L.J. 831, 834 (1980) (“The rejection of intercircuit stare decisis is premised upon—and given the obvious costs in deferring uniformity, is explainable only in terms of—the benefits of dialogue among the circuits.”); see also Maxwell Stearns, Standing Back from the Forest: Justiciability and Social Choice, 83 Cal.
L. REV. 1309, 1351–52 (1995) (arguing, based upon social choice theory, that the Supreme Court “would desire intra- but not inter-circuit stare decisis,” since such a regime “avoids the irrationality that would result from cyclical preferences within particular circuits, while, at the same time, reducing the likelihood that legal doctrine that results from path manipulation in a given circuit will be replicated across the circuits.”). But cf. O’Hara, supra note 17, at 772 (arguing that the absence of stare decisis across circuits is justified on the ground that “an agreement to follow another circuit’s precedents will not save the judges in a particular circuit much time”). In the case of appeals of core bankruptcy matters, there are, anomalously, two levels of intermediate appeals. Perhaps, then, in order for issues properly to percolate up to the courts of appeals, there ought to be no horizontal stare decisis at the first intermediate level—that is, at the level of the BAPs and district courts.

Second, given that the BAPs and district courts lie at the same hierarchical level, it might not make sense for horizontal stare decisis rules to apply to BAPs but not district courts. Perhaps, once again, horizontal stare decisis should not apply at all. One might argue, to the contrary, that horizontal stare decisis should apply to both courts. See Chemerinsky, supra note 4, at 129.

Third, perhaps bankruptcy law and society would be better served by a system other than the traditional appellate hierarchy, at the lower levels of appeals of core bankruptcy matters. Civil law systems rely far less on precedent than does the common law system dominant in the United States. See supra note 15 and accompanying text. Civil law judiciaries decide cases based largely upon the proper interpretation of the governing “code.” Insofar as bankruptcy turns upon the content of a code—the “Bankruptcy Code”—bankruptcy seems to provide an ideal setting for application of such judicial review. Cf. Lawrence Ponoroff, The Dubious Role of Precedent in the Quest for First Principles in the Reform of the Bankruptcy Code: Some Lessons from the Civil Law and Realist Traditions, 74 AM. BANKR. L.J. 173, 216 (2000) (arguing for “a softer, more nimble, rule of precedent [that] would improve the quality of outcomes in particular bankruptcy cases”). Interestingly, while Ponoroff facially argues in favor of increased reliance on a civil law jurisprudential approach in the bankruptcy context, his arguments do not seem to accord so well with the principles underlying the structure of judicial review in civil law systems. Dean Ponoroff laments:

The opportunity for two levels of appeal as a matter of right has contributed to the crush of reported decisions, a phenomenon that, in my view, has hampered pragmatic and considered decisionmaking in the bankruptcy courts. That problem is compounded by the disturbing rise in adherence to textual or plain meaning methods of interpretation in bankruptcy cases, particularly in the decisions of the circuit courts of appeal[s].

Id. at 181 (footnotes omitted). Ponoroff thus seems more concerned with allowing different interpretations of the Bankruptcy Code to percolate up through the judiciary. He also seems to embrace more of a realist conception of bankruptcy law than a civil law conception, explaining that “[a] more forward-looking, and less technical and ‘busy,’ code would abate the pressure to decide and review cases on the kind of formal, textualist grounds that typically prove the most difficult to distinguish in subsequent cases.” Id. at 216. Indeed, Ponoroff acknowledges that he endorses “a different style of judging, one that eschews a strict adherence to precedent, but not by any means civilian, to the extent that style is perceived as the unimaginative and rote application of positive legal rules to particular fact situations performed by a cadre of mid-level bureaucrats.” Id. at 223. “Rather,” he endorses “a style that actually places greater responsibility on the decisionmaker to reason analogically from code principles, as well as from subsidiary sources such as custom, usages, settled jurisprudential doctrine, and equity.” Id. at 223–24.

To the possible objection that the fact that the higher levels of bankruptcy judicial review—courts of appeals and the Supreme Court—rely upon the standard appellate hierarchy, one can point to the coexistence of Louisiana’s civil law system within the United States judicial system as an example of how such a system can function. See, e.g., Shelp v. Nat’l Sur. Corp., 333 F.2d 431, 439 (5th Cir. 1964) (in determining Louisiana law under Erie, federal courts should apply precedential rules that Louisiana’s highest court would apply); Alvin Rubin, Hazards of a
It is only the final criterion—the question of judicial independence—on which district courts have some advantage over bankruptcy appellate panels. Judicial independence has been considered to be a function of life tenure and the guarantee of nonreduction in salary. Both attributes are enshrined in the Article III status conferred on district judges, whereas bankruptcy judges who sit on bankruptcy appellate panels do not get the benefit of either attribute because of their non-Article III status.74

On this basis, one might readily conclude that district judges enjoy judicial independence while bankruptcy judges do not. But this would be a facile conclusion that improperly casts the assessment of judicial independence as an all-or-nothing proposition—that is, judicial independence is attainable only through life tenure and the guarantee of nonreducible remuneration. Careful consideration of the matter, however, suggests that the difference may be narrower than that generally perceived by courts and commentators.

A more felicitous account reveals that the term of appointment for bankruptcy judges, the standard for their removal from office, the treatment of their compensation, and the manner of their appointment afford bankruptcy judges a moderate amount of judicial independence. First, although bankruptcy judges are not granted life

74. See supra notes 36–38 and accompanying text.
tenure, their terms last fourteen years.\textsuperscript{75} Moreover, their appointments may be renewed,\textsuperscript{76} and indeed in most cases are renewed.\textsuperscript{77} While judicial independence may be fostered by life tenure, the renewable, fourteen-year term of bankruptcy judges effectively allows them to serve as long as many of their Article III counterparts.\textsuperscript{78} Even if the absence of life tenure gives Congress leeway to reduce the term of bankruptcy judges—\textsuperscript{79} an option that it has never exercised since it created the bankruptcy courts—the fourteen-year, renewable term still grants a fair amount of judicial independence to bankruptcy judges.\textsuperscript{80}

Second, the Judicial Code prescribes that a bankruptcy judge may be removed “only for incompetency, misconduct, neglect of duty, or physical or mental disability,”\textsuperscript{81} whereas the Constitution mandates that an Article III judge will hold his or her office only “during good Behaviour.”\textsuperscript{82} The broad language of the good-behavior standard for

\footnotetext{82}{U.S. CONST. art. III, § 1.}
\end{footnotes}
removal arguably encompasses the grounds set forth by the Judicial Code for removal of bankruptcy judges. Moreover, while Article III judges may be removed only by impeachment,83 and bankruptcy judges may be removed by a majority of all of the judges of the judicial council of the bankruptcy judge’s circuit,84 the practical reality is that very few bankruptcy judges have been removed from office.85 If the specter of removal does not appear to be greater for bankruptcy judges than Article III judges, it follows that bankruptcy judges need not limit their behavior in ways that would prevent them from acting as independently as Article III judges.

Third, although the Supreme Court has identified the “fixed and irreducible” compensation provided to Article III judges by the Compensation Clause as a hallmark of an independent judiciary,86 the lack of a similar guarantee in the salaries of bankruptcy judges should not be overemphasized in assessing their judicial independence. Since Congress enacted the Bankruptcy Code in 1978 and created the current scheme for federal bankruptcy judgeships, the salary of bankruptcy judges has only increased.87 Moreover, since 1987, bankruptcy judges have received a salary at an annual rate that equals 92% of the salary of district court judges (as determined by section 135 of the Judicial Code).88 Thus, for the past two decades, bankruptcy judges have had fixed compensation that nearly equals that of district court judges.

Finally, if one takes into account the substantive differences in the appointment processes of bankruptcy judges and district judges and the consequences that flow therefrom, it becomes clear that bankruptcy judges may be better situated than district judges to resist the political influence that would threaten to compromise an independent judiciary. While the judicial appointment process for

84.  28 U.S.C. § 152(e).
85.  See Mabey, supra note 62, at 107 (listing reasons for departure from the bench for the 115 bankruptcy judges who did so in the decade prior to 2005, but not mentioning removal as one of those reasons). On the other hand, one might argue that the low rate of removal of bankruptcy judges reflects the absence of judicial independence: bankruptcy judges have behaved in a way so as to avoid removal.
86.  N. Pipeline, 458 U.S. 50 at 59 (Brennan, J., plurality opinion).
87.  See Mabey, supra note 62, app. A.
Article III judges has become increasingly politicized, evidenced most recently by the tendency for close examination of the ideology of nominees, the appointment process for bankruptcy judges has seemingly remained nonpolitical. The Judicial Code charges the appointment task to the court of appeals for the circuit in which there exists a vacancy for a bankruptcy judgeship. Thus, the appointment process involves judges selecting judges—a presumably nonpolitical process. This nonpolitical process has produced a bankruptcy bench

89. See Nash, supra note 20, at 2182–92.
91. The possibility exists, however, that the judicial appointment of judges may substitute judicial patronage for political patronage and thus compromise judicial independence. See Judith Resnik, “Uncle Sam Modernizes His Justice”: Inventing the Federal District Courts of the Twentieth Century for the District of Columbia and the Nation, 90 GEO. L.J. 607, 673 (2002). But see Posner, supra note 23, at 81–82 (“Appointments by the judicial branch are not as controversial, because judges belong to different parties.”). Furthermore, one may argue that, insofar as the circuit judges are a product of a politicized appointment process, they themselves may be politicized and thus infuse politics into the appointment process for bankruptcy judges. The merit-selection process for appointing bankruptcy judges, however, seems to have provided little opportunity for such politicization to take root. A quick look at the manner in which the Ninth Circuit conducts this process (one that seems representative of the process conducted in other circuits) suggests why this has been the case.

Interested candidates must submit applications for the position. See Judicial Council of the Ninth Circuit, Regulations Governing the Appointment of U.S. Bankruptcy Judges § 2.02 (2001), available at http://207.41.19.15/Web/OCELabra.nsf (follow “Bankruptcy” hyperlink; then follow “Regulations Governing the Appointment of U.S. Bankruptcy Judges” hyperlink) (last visited Oct. 25, 2008). The Circuit advertises nationally and encourages the federal judicial districts within the circuit to advertise intensely and locally. Id. § 2.01. A local merit screening committee, which generally consists of (1) the chief judge of the district in which the bankruptcy judge is to be appointed, (2) the president of the state bar association, (3) the president of one or more local bar associations within the district, (4) the dean of a law school located within the district, (5) the administrative circuit judge of the circuit geographical unit in which the bankruptcy judge is to be appointed, and (6) the chief bankruptcy judge of the district in which the bankruptcy judge is to be appointed. Id. § 3.02(a). The committee recommends five applicants to the Court-Council Committee on Bankruptcy Appointments, whose membership includes three circuit judges who serve as voting members. See id. §§ 3.03(c)(1), 3.04(b). The Court-Council Committee circulates a report to the Ninth Circuit Judicial Council recommending a candidate for appointment, and that report will be deemed to be the Judicial Council’s recommendation to the Court of Appeals (unless the Council determines that the Court-Council Committee should reconsider its recommendation). Id. §§ 3.04(c)(5), 3.05(a). The recommended candidate is appointed upon a majority vote of the members of the Court of Appeals. 28 U.S.C § 152(a)(3) (2000).

populated mostly by specialists with bankruptcy expertise\textsuperscript{92} who themselves could be characterized as nonpolitical.\textsuperscript{93}

When one considers the type of jurist produced by the judicial selection process for bankruptcy judges in conjunction with their term of appointment, the standard for their removal, and the treatment afforded to their compensation, it would appear that bankruptcy judges have achieved a considerable degree of judicial independence.\textsuperscript{94} Accordingly, while the district court seems to enjoy some advantage over BAPs with respect to this final attribute identified as improving the quality of appellate review, the advantage is not likely to be substantial. We summarize the differences in the attributes of the BAPs and district courts below in Table 1.

\begin{table}[h]
\centering
\caption{Structure of District Courts and Bankruptcy Appellate Panels}

\textbf{B. Hypotheses}

Insofar as BAPs exhibit more of the features associated with quality appellate review than do federal district courts, the discussion in Part I suggests that BAPs will provide a higher quality of

\begin{itemize}
\item \textsuperscript{92} See Mabey, \textit{supra} note 62, at 107 ("Most of the bankruptcy judges were bankruptcy practitioners in their prior careers.").
\item \textsuperscript{93} Cf. Resnik, \textit{supra} note 91, at 670 ("Turn first to the advantages of judicial appointment of judges. As a few details of current practices illustrate, the judiciary has selected a high-quality and relatively nonpolitical corps of judges . . . .")
\item \textsuperscript{94} This state of affairs can be traced to congressional efforts in the 1970s to elevate the status of bankruptcy judges. Congress established in 1970 the Commission on the Bankruptcy Laws of the United States to evaluate the then-existing bankruptcy system and to suggest recommendations for its reform. Pub. L. No. 91-354, 84 Stat. 468 (1970). In its report, the Commission envisioned that improvements in the appointment, tenure, and compensation of bankruptcy judges would enhance their "real and apparent judicial independence." \textsc{Comm'n on the Bankr. Laws of the U.S., Report of the Commission on the Bankruptcy Laws of the United States, H.R. Doc. No. 93-137, pt. 1, at 95} (1973).
\end{itemize}
bankruptcy appellate review than their district court counterparts—assuming, of course, that the question of judicial independence does not outweigh other factors. Many challenges stand in the way of investigating this general claim, chief among them the difficulty in empirically testing the “correctness” of the dispositions rendered by the appellate court. Knowledge of this would be crucial for purposes of ascertaining whether the appellate court had appropriately performed its appellate function—that is, identifying error in those instances when it occurred. Making such a determination would necessarily involve content analysis of appellate opinions according to a particular metric of correctness. It is difficult to develop such a metric without infusing a degree of inherent subjectivity into its design. What we may deem to be a “correct” decision may be “incorrect” according to others. Accordingly, at the initial stage of empirical inquiry, we are not persuaded that detailed content analysis of appellate opinions is warranted.95

Absent detailed content analysis of appellate opinions, how might we empirically proceed with our inquiry into the quality of appellate review? Although we cannot empirically test the “correctness” of decisions, we can empirically test the perception held by other actors within the bankruptcy judicial system of the correctness of those decisions. For those bankruptcy appeals that proceed to the second tier of review, we can consider whether the court of appeals deemed proper the disposition rendered by the first-tier appellate court.

There are several ways in which the rate at which a higher court upholds a lower court’s disposition may shed light upon judicial perceptions of correctness of lower court decisions.96 First, there is a tautological sense in which what an appellate court says is, by

---

95. Professor Frank Cross has expressed a similar view in his empirical study of decisions rendered by U.S. Courts of Appeals:

[T]here are typically nonfrivolous legal arguments for each side in circuit court cases, so it is impossible to code certain cases as being legally correct (or incorrect) without the researcher second-guessing and effectively overriding the judge. Such an approach offers an unreliable tool for evaluating judicial decisions because it probably reflects more about the researcher than about the judges being evaluated. Research requires a more objective tool for evaluating the law.

definition, correct (unless, that is, the appellate court decision is itself reversed). Thus, if an appellate court affirms the disposition of a lower court, then the lower court’s disposition was correct. Second, one can presume that the appellate court wishes to resolve the legal issues “correctly” for the parties and for future courts. The law generally calls upon appellate courts to examine legal issues de novo without deference to the reasoning or conclusion of the court below. Still, if the appellate court ultimately reaches the same conclusion as the court below, then it is accurate to say that the appellate court perceived the lower court’s conclusion to be correct.

However, courts of appeals may not always affirm a decision because they believe the earlier decision was “correct.” Judges need not be so selfless. Indeed, there is a school of thought that views judges, like all people, as self-interested actors. Judges may be interested in keeping their jobs—for bankruptcy judges, this translates to reappointment. Insofar as district judges enjoy Article III status, they have life tenure and are guaranteed not to suffer any salary reductions. Still, even Article III judges may have dreams of

97. See supra note 17.

99. It is possible that, notwithstanding the legal standard to the contrary, appellate courts do not always reexamine legal issues de novo in practice. Perhaps, for example, courts of appeals are inclined to rely upon the expertise of BAPs (sub rosa, of course, since the law dictates otherwise) and thus are inclined to affirm BAP opinions. Or, perhaps equally, the appellate courts might more often than not affirm district court opinions on the ground that district judges enjoy Article III status and thus are independent. In either case, it would be accurate to view an appellate court affirmation as embracing the lower court opinion as correct.

100. See O’Hara, supra note 17, at 737–38 (suggesting that judges make decisions “to impose their normative views, beliefs, and mores on [society]”); Richard A. Posner, What Do Judges and Justices Maximize? (The Same Thing Everyone Else Does), 3 SUP. CT. ECON. REV. 1, 39 (1993) (“Judges are rational, and they pursue instrumental and consumption goals of the same general kind and in the same general way that private persons do.”).
higher office. Article III judges—and, for that matter, BAP judges—may also wish to avoid the “ignominy” of reversal by a higher court.

Even if BAP judges and district judges have an aversion to reversal, that ought not to change appellate judges’ behavior in terms of upholding the conclusion of lower court decisions, assuming at least that the reappointment or elevation process does not demand political decisionmaking. Put another way, a judge—whether a bankruptcy judge serving on a BAP or a district judge—who wants to be reappointed or elevated has essentially the same incentive to decide cases correctly as do judges who simply want to decide the disputes before them correctly. As such, a court reviewing a first-level intermediate bankruptcy appellate decision—whether a panel of a court of appeals or the Supreme Court—should adopt the conclusion of the lower court if it deems that conclusion to be “correct.” Similarly, appellate court judges should seek to affirm correct decisions—and reverse incorrect ones—even if their motives are not strictly to reach correct outcomes.

Based upon the foregoing, we offer the following hypothesis.

Hypothesis 1: Courts of appeals more likely will uphold the dispositions rendered by BAPs than those rendered by district courts.

Citation rates provide yet another basis on which to test empirically the perceived correctness of an appellate opinion. To the

101. See Nash, supra note 20, at 2196. Indeed, Professor Resnik has identified such careerism by bankruptcy judges. See Resnik, supra note 91, at 673 (observing that “[a]n increasingly well-trodden path is for a person to shift from magistrate or bankruptcy judge to district court judge”). A recent study of the bankruptcy bench, however, indicated that only eight of the 115 bankruptcy judges who left the bench from 1995 to 2005 did so as a result of appointment to an Article III judgeship. Mabey, supra note 62, at 107.

102. See, e.g., Caminker, supra note 13, at 827 & n.40 and the authorities cited therein; see also Nash, supra note 20, at 2197–98 (discussing the desire of Article III judges to avoid impeachment, public chastisement, and overruling by the legislature).

103. Note, however, that other motivations may explain bankruptcy judges’ behavior. See, e.g., Lynn M. LoPucki, Courting Failure: How Competition for Big Cases Is Corruption the Bankruptcy Courts (2005) (arguing that bankruptcy judges in different districts compete for large corporate bankruptcy cases); Marcus Cole, ‘Delaware Is Not a State’: Are We Witnessing Jurisdictional Competition in Bankruptcy?, 55 Vand. L. Rev. 1845, 1890–93 (2002) (arguing that, in order to conform to dominant state culture favorable to corporations, Delaware bankruptcy judges compete for corporate bankruptcy filings).

extent that citation of one court by another reflects the citing court’s view that the other court was “correct” in some way, the notion of correctness is, in different ways, both narrower and broader than correctness in the context of affirmation on direct appeal. It is narrower in that the citing court well may be citing a case not based upon a broad holding, but rather based upon some narrow holding or even dicta. It is broader in that, unlike a court that affirms a lower court’s disposition even though it disagrees with its reasoning, a court that cites to another court’s decision positively at some level agrees with some aspect of the court’s reasoning.105 Of course, there may be situations where a court cites another court’s opinion simply because it perceives the other court’s opinion to be binding precedent.106 For this reason, we consider the results of extracircuit citations and citations by courts of appeals to BAPs and district courts—settings where there is no issue of binding precedent and citation is purely a matter of choice—to be especially informative.107

Within this context, one can point to two broad notions as to why courts cite other courts’ opinions; both accord with our broad understanding of “correctness.” First, a court may cite to another court’s decision because it is truly influenced by the other court’s reasoning.108 If this is true, then the citing court in some sense finds the other court’s reasoning to be “correct.” Alternatively (or perhaps in addition), a court may cite to another court’s decision not so much to explain the basis for its decision as to justify that decision, thus

---

105. See Landes & Posner, supra note 104, at 251 & n.3 (excluding from citation study “citations indicating rejection of the cited case as a precedent”). Our study also includes only positive citations. But see Landes et al., supra note 104, at 273 (deciding “not [to] distinguish . . . between favorable, critical, or distinguishing citations” insofar as “[c]ritical citations, in particular to opinions outside the citing circuit, are also a gauge of influence since it is easier to ignore an unimportant decision than to spell out reasons for not following it”).

106. See Landes & Posner, supra note 104, at 251 (excluding from citation study nonprecedential citations).

108. See id. at 339 (suggesting that citations may “indicate intercourt communication and influence on judicial decisionmaking”); cf. McKenna & Wiggins, supra note 65, at 651 (“The availability of published opinions is generally thought to be an important aspect of the appellate process because written opinions provide guidance to judges and litigants by explaining the reasons for the appellate decision.”).
making the “primary function” of citations one of “legitimation.”

Even if a court simply cites to another court to legitimate its own conclusions, we would say that the citing court perceives of the other court’s reasoning as “correct” in some sense. Indeed, the citing court is using the citation to bolster the perception that its own reasoning and conclusions are “correct.”

In light of the foregoing, and as detailed below, we proceed to test the perceived correctness of an appellate opinion by considering (1) the propensity of other federal courts within the bankruptcy judicial structure to cite the opinions issued by first-tier appellate courts, (2) the depth of treatment given to such opinions by federal citing courts (including direct quotation), and (3) the immediacy with which such opinions garner a citing reference. Accordingly, we offer the following additional hypotheses.

_Hypothesis 2A: Federal courts more likely will positively cite to BAP opinions than to district court opinions._

_Hypothesis 2B: Federal courts will positively cite to BAP opinions more frequently than to district court opinions._

_Hypothesis 3: Courts of appeals will cite more frequently to BAP opinions than to district court opinions._

_Hypothesis 4: Bankruptcy courts will cite more frequently to BAP opinions than to district court opinions._

_Hypothesis 5: BAPs will cite more frequently to BAP opinions than to district court opinions._

_Hypothesis 6: District courts will cite more frequently to district court opinions than to BAP opinions._

_Hypothesis 7: Federal courts outside of the circuit of the first-tier appellate court that issued the opinion (extracircuit federal courts) will cite more frequently to BAP opinions than to district court opinions._

_Hypothesis 8: Positive federal citing references will afford a greater depth of treatment to BAP opinions than to district court opinions._

109. Walsh, supra note 107, at 339.

110. Cf. id. at 342 (distinguishing between “strong” and “weak” citations).
Hypothesis 9A: Positive federal citing references are more likely to quote directly BAP opinions than district court opinions.

Hypothesis 9B: Positive federal citing references will directly quote BAP opinions more frequently than district court opinions.

Hypothesis 10: The time within which a federal citing reference will be made to opinions issued on appeal by BAPs will be faster than to those issued by district courts.

Notably, in Hypotheses 2B, 3, 4, 5, and 7, we hypothesize that BAP opinions will be cited more often than district court opinions. We suggest this on the ground that several factors weigh in favor of the conclusion that BAPs will resolve issues of bankruptcy law "correctly," while only one factor—judicial independence—weighs in favor of district courts.

It seems to us highly probable, a priori, that bankruptcy judges and BAP judges are unlikely to be concerned with the fact that the bankruptcy judges who serve on BAPs do not enjoy Article III status. Accordingly, we have developed Hypotheses 4 and 5. Hypothesis 3 is to similar effect. It seems to us that courts of appeals would be more focused on the structural factors favoring BAPs than the lack of Article III status—particularly with respect to subject-matter expertise. Note first that, to the extent that the absence of Article III status may suggest a lack of independence vis-à-vis the issues in the case or the parties, that problem is greatly ameliorated by the fact that the parties must have consented in order to have the BAP issue a decision in the first place. Second, court of appeals judges presumably do not need the buffer of Article III status to remind them that they sit several notches above bankruptcy judges and BAPs on the judicial food chain.

The same cannot be said for district judges. That district judges lobbied against giving bankruptcy judges Article III status demonstrates how important it is to district judges that bankruptcy

111. See McKenna & Wiggins, supra note 65, at 628 ("Bankruptcy appellate panel (BAP) judges provide specialized bankruptcy expertise that their bankruptcy colleagues . . . value highly as a source of authority.").

112. See id. at 678 ("Circuit judges, on average, have less specialized knowledge than bankruptcy judges, particularly those selected to serve on BAPs.").

113. It is also conceivable that courts of appeals in circuits that have BAPs are somewhat favorably inclined to cite to those BAPs, to the extent that they consider the BAPs to be adjuncts of the courts of appeals. See supra note 51.
judges not enjoy this status. Further, district judges lie on the same level as BAPs on the bankruptcy appellate hierarchy. In short, it seems that district judges will think of BAPs as coequals in terms of hierarchy at best, and as subordinates at worst. Accordingly, we think it comparatively less likely that district judges, as opposed to other federal judges, would look to opinions authored by BAPs as opposed to district judges. It is on these bases that we preliminarily offer Hypothesis 6.

Given our hypotheses that other courts within the bankruptcy judicial structure are more likely to cite to BAP opinions (with the exception of Hypothesis 6), we further hypothesize that the underlying motivations prompting such citation practices will also lead these courts to discuss BAP opinions in greater detail and to cite to BAP opinions with more immediacy. We thus propose Hypotheses 9 and 10.

We now turn to evidence from the findings of our study and use that evidence to evaluate our hypotheses empirically.

III. EMPIRICAL ANALYSIS OF THE PERCEIVED QUALITY OF APPELLATE REVIEW: EVIDENCE FROM APPELLATE BANKRUPTCY OPINIONS

This Part presents the results of our empirical study of appellate bankruptcy opinions issued both at the first-tier and second-tier levels of appellate review in the bankruptcy judicial system. We test the hypotheses discussed above in Part II.B through the use of quantitative methodology and look for patterns that point to a relationship between the type of appellate court and the manner in which others perceive the quality of review provided by the court. In doing so, we seek to evaluate the theoretical assumptions that have evolved regarding those attributes considered to improve the quality of appellate review. We emphasize, however, that we do not purport to provide either a definitive or exhaustive account. We readily admit that we have chosen to study a narrow set of data from a snapshot in time that is not necessarily representative of the general universe of bankruptcy appeals. Aware of these limitations, we nonetheless have strong convictions that a great deal of valuable information can be gleaned from the data and that this information will help guide future discussions. Ultimately, our goal is to begin a shift away from generalization and abstraction and to generate a more concrete

114. See supra note 37 and accompanying text.
115. See supra fig.1.
understanding of how differences in appellate structure affect the quality of appellate review.

This Part proceeds as follows. Part III.A sets forth the selection criteria used to constitute the sample for our study, discusses the major variables that we studied and incorporated into our statistical models, and details the general characteristics of the sample. Part III.B presents descriptive statistics comparing perceptions of the quality of appellate review provided by BAPs with perceptions of the quality of appellate review provided by district courts. Part III.C presents the central findings from our regression models, and Part III.D interprets our results.

If those attributes identified as improving the quality of appellate review truly do so, we would expect to see a positive relationship between BAP opinions and their perceived quality. Furthermore, we would expect this relationship to be stronger than the relationship, if any, between district court opinions and their perceived quality. In summary, we find that the rates at which courts of appeals affirm appeals from BAPs and district courts provide support for the claim that BAPs are perceived to provide a better quality of review than the district courts. Furthermore, data on subsequent citation by federal courts to the opinions rendered on appeal by BAPs and district courts lend considerable support to the claim. Given the possible impact of selection effects on the affirmance data as opposed to the citation data, we consider the strongly robust results we observe in the citation context to be more informative.

A. Sample Selection and Variables of Interest

1. Sample Selection

To constitute the sample of appellate bankruptcy opinions for this study, we formulated a search query in Westlaw’s FBKR-CS database, which contains reported and unreported case law documents (i.e., decisions and orders) relating to bankruptcy that were issued by various courts—including the Supreme Court, circuit courts of appeals, BAPs, district courts, and bankruptcy courts.116 Because we sought to create two separate databases, one for first-tier appellate dispositions by BAPs and district courts (the “first-tier database”) and one for second-tier appellate dispositions by courts of appeals (the

116. Reported case law documents are those released for publication in West Federal Reporters.
“second-tier database”), we ran two separate search queries. The first query consisted of the single term “11 U.S.C.,” the standard citation to title 11 of the United States Code (commonly referred to as the “Bankruptcy Code”), coupled with (1) a date restriction that limited query retrieval to decisions and orders issued during the three-year period beginning on October 1, 1997 and ending on September 30, 2000; and (2) a field restriction that limited query retrieval to decisions and orders whose preliminary field contained either the term “district court” or “bankruptcy appellate panel,” but not “court of appeals.” The second query mirrored the first query with the exception that the field restriction limited query retrieval to decisions and orders whose preliminary field only contained the term “court of appeals.” The first query produced 1,487 documents, while the second query produced 871 documents. These large numbers clearly presented a challenge by virtue of the time it would take to review each document. We sought to reduce the time demand by randomly selecting for review approximately one-quarter of the documents produced by each search query—specifically, 372 documents from the first search query and 218 documents from the second search query. In order to identify those that would be selected for inclusion and analysis in the two databases, we reviewed these documents according to the procedures described below.

We sought to include in the databases appeals that involved the resolution of dispositions rendered by bankruptcy courts in core proceedings. We included only those documents that disposed of the appeal on the merits. (Because most of these documents were opinions rather than orders, for ease of reference we will collectively refer to the documents as opinions for the remainder of the Article.) Opinions that solely involved procedural dispositions (e.g., dismissal for lack of

117. Coverage for the FBKR-CS database begins with the year 1789.
118. In its entirety, the first search query was as follows: “11 u.s.c.” & pr (“district court” “bankruptcy appellate panel” % “court of appeals”) & da (aft 9/30/1997 & bef 10/01/2000).
119. In its entirety, the second search query was as follows: “11 u.s.c.” & pr (“court of appeals”) & da (aft 9/30/1997 & bef 10/01/2000).
120. Each search query produced a numbered result list in which the opinions were listed in reverse chronological order. For the first-tier database, the results were organized by court in reverse chronological order (i.e., district court opinions were listed first in reverse chronological order followed by BAP opinions listed in reverse chronological order). We used a random number generator to select the opinions from each result list that we would analyze. For each result list, we randomly generated a set of unique numbers falling within the range of the total documents retrieved by the search query.
121. See supra notes 49–50 and accompanying text.
jurisdiction) were excluded. In most instances, each opinion generated one observation. However, some opinions generated multiple observations. For example, some opinions resolved multiple appeals in separate and unrelated bankruptcy cases. In other instances, an opinion would resolve an appeal of separate orders that were entered by the bankruptcy court in distinct proceedings within the same case. Finally, by virtue of the identical date restriction included in both search queries, each opinion was issued during one of three government fiscal years: 1998, 1999, or 2000.122

Pursuant to these selection procedures, our first-tier database consists of 268 observations drawn from 264 opinions,123 4 of which produced a second observation. Our second-tier database consists of 170 observations drawn from 165 opinions,124 5 of which produced a second observation. Not surprisingly, for both databases, the majority of appeals wended their way through the district courts rather than the BAPs—although more so for appeals in the second-tier database (approximately 81%) than the first-tier database (approximately 60%).

122. We tailored our search in this manner for two reasons. First, we wanted to facilitate comparisons of our data with official government data regarding bankruptcy appeals. Generally, such data track the government’s fiscal year, which begins on October 1st and ends on September 30th, rather than the calendar year.

Second, we chose the specific time period for this study in order to capture the BAP experience at its apex in terms of participating circuits. BAPs did not become a fixture of the bankruptcy judicial system until 1996. The enactment of the Bankruptcy Code in 1978 amended the Judicial Code to permit, but not require, the establishment of BAPs on a circuit-by-circuit basis. Only the First and Ninth Circuits chose to do so, establishing their BAPs in 1979 and 1980, respectively. In the wake of the Marathon decision, however, the First Circuit concluded that continued operation of a BAP would be inappropriate until Congress remedied the defects in the constitutionally infirm, bankruptcy jurisdictional scheme. Massachusetts v. Dartmouth House Nursing Home, Inc., 726 F.2d 26 (1st Cir. 1984).

The Ninth Circuit reached the opposite conclusion in Briney v. Burley (In re Burley), 738 F.2d 981 (9th Cir. 1984), holding that circuit court supervision of the BAP satisfied Marathon’s requirement of Article III judicial review. Despite the measures taken by Congress in 1984 through the Bankruptcy Amendments and Federal Judgeship Act to address the Marathon decision, the First Circuit Judicial Council chose not to reauthorize its BAP, thus leaving the Ninth Circuit as the only circuit with an operating BAP. This state of affairs changed with the Bankruptcy Reform Act of 1994, which amended the Judicial Code to require the judicial council of each circuit to create a BAP absent a finding by the council that (1) insufficient judicial resources in the circuit would preclude its establishment, or (2) that establishment of a BAP would produce undue delay or increased cost to parties in bankruptcy cases. Pub. L. No. 103-394, § 104(c)(3), 108 Stat. 4106, 4109 (codified at 28 U.S.C. § 158(b)(1)). Prompted into action by this amendment, in 1996 the First Circuit reauthorized and the Second, Sixth, Eighth, and Tenth Circuits established BAPs. The Second Circuit BAP, however, ceased operations on July 1, 2000.

123. Thus, our selection criteria reduced the random sample of documents relating to the first-tier database by approximately 18%.

124. Similar to the first-tier database, see supra note 123, our selection criteria reduced the random sample of documents relating to the second-tier database by approximately 17%.
The distributions of opinions by circuit in each database roughly approximate one another.125

As stated before, we do not seek in our study to make claims about the unobserved population of bankruptcy appeals but rather confine our commentary to the observed sample of data we have amassed. That said, we recognize that the story we seek to tell may not be as compelling if selection bias accounts for the results that we present. Accordingly, we seek to alleviate concerns regarding two major types of potential selection bias stemming from litigant choices that could produce a distorted picture: (1) case-selection bias and (2) forum-selection bias.

It has been theorized that cases adjudicated at the trial level represent a nonrandom group by virtue of litigant choices.126 For a host of reasons, litigants may choose only a select group of cases for which to pursue a final adjudication by a trial court. If tried cases substantively differ from settled cases, a study that focuses solely on tried cases will misrepresent the larger world of litigation because most cases settle.127 An appeal further exacerbates the selection bias because (1) not all adjudicated cases are appealed and (2) not all appealed cases are disposed of by court decision. The bankruptcy appellate structure doubly compounds the problem given the two levels of intermediate appellate review.

If these assumptions are correct, should they be of overriding concern in a study such as ours? We think not for the following reasons. First, case-selection bias should not impact our citation data insofar as a court is generally constrained to written opinions when it chooses those opinions to which it cites. Second, cases settled either at the trial or at the appellate level are not a relevant population for purposes of our study. Our study asks whether the circuit court will perceive the BAP to have performed the appellate function better than the district court. Because circuit courts are not autonomous decisionmaking bodies and can only resolve those appeals brought before them by the litigants, the only cases that can and should be measured for this purpose are those cases actually appealed to and

125. See infra Appendix tbl.1.
resolved by the circuit courts.  

Last, Professor Frank Cross’s comprehensive empirical study of decisionmaking by the courts of appeals has documented that litigant effects are not a major determinant of circuit court decisions, both generally and in particular types of cases (i.e., criminal decisions and labor decisions).

We also recognize that our data potentially include a forum-selection bias because attorneys in circuits that have BAPs may be more likely to prefer appeals relating to certain subject matters to be heard by BAPs than by district courts, or vice versa. Thus, it is possible that there are some issues that BAPs never or only rarely hear. (Assuming that bankruptcy cases are at some level homogenous nationwide, that will not be the case for district courts, because there are circuits in which district courts hear substantially all appeals from bankruptcy court rulings.) More generally, it is possible that BAP and district court dockets vary substantially. While we cannot eliminate this possibility, we have looked for evidence of such a bias and have found no such evidence. Thus, while recognizing that such a bias

128. Even if the group of appeals resolved by the circuit courts are nonrandom such that our results would not hold if the circuit courts also decided those cases that were not appealed beyond the first level of intermediate review, such theorizing is an exercise in futility. Simply put, we cannot measure the outcomes of circuit court decisions that do not exist. In other words, because we look to measure quality of appellate review that the circuit court perceives, we ought not to fret about those cases that will never see light of day in the circuit court.

129. Cross, supra note 95, at 123–47.

130. Because the Judicial Code mandates that, in circuits with BAPs, bankruptcy appeals will be heard by the BAP unless one of the parties to the appeal elects to have the district court hear the appeal, 28 U.S.C. § 158(c)(1) (2000 & Supp. V 2005), the dynamic of any potential selection bias at work in the BAP perhaps should be understood as the product of the subset of appeals where the forum preferences of the parties to the appeal have aligned. Although there could be instances where all parties prefer to have the appeal heard by the district court, there would also be instances where only one party had such a preference. Thus, a BAP docket is unique in that all of its appeals theoretically involve litigants with a consistent forum preference. We say “theoretically” since it is conceivable that a party with an inconsistent forum preference may have failed, in a timely fashion, to elect a district court to hear the appeal.

131. Because we do not differentiate between district courts from circuits with BAPs (BAP circuits) and those from circuits without BAPs (non-BAP circuits) in our analyses, there is concern that any potential selection bias at work in BAP circuits could be masked by those observations from non-BAP circuits. Approximately 31% of the observations in the first-tier database and 36% of the observations in the second-tier database consisted of district court opinions from non-BAP circuits. See infra Appendix tbl.1. We conducted bivariate statistical analyses to ascertain whether selection bias existed in the BAP circuits by focusing on those circumstances in which one would expect to see such bias have a disproportionate effect—namely, (1) the subject matter of the appeal and (2) affirmance rates by the court of appeals. For neither of these circumstances did we find evidence of selection bias.

First, we examined whether a statistically significant relationship exists in BAP circuits between the subject matter of the appeal and the first-tier appellate court to hear the appeal. To do so, we classified observations according to whether the subject of the appeal fell into one of the four most frequently occurring subjects of appeal heard by first-tier appellate courts. For the
may lurk at more refined levels of case-type delineation, we are at least confident that the size of any forum-selection bias is confined, not pernicious, and thus probably has not had a meaningful effect upon our data and analysis.132

For the first-tier database, for all observations, and for those observations from BAP circuits, the four most frequently occurring subjects were matters relating to discharge, procedure/jurisdiction, avoiding powers, and multiple subjects. For the second-tier database, for all observations and for those observations from BAP circuits, the four most frequently occurring subjects were matters relating to discharge, claims, avoiding powers, and multiple subjects. For the first-tier database, approximately 56% of the appeals heard by district courts in BAP circuits as well as all district courts combined involve one of the four most frequently occurring subjects. For the second-tier database, approximately 64% of the appeals heard by district courts in BAP circuits and 59% of the appeals heard by all district courts combined involve one of the four most frequently occurring subjects. After applying a chi-square test with one degree of freedom, we found no statistically significant relationship in BAP circuits between the subject matter of the appeal and the first-tier appellate court to hear the appeal (a p-value of 0.288 for the first-tier database and a p-value of 0.876 for the second-tier database).

Second, for all observations in the first-tier database, we examine whether a statistically significant relationship exists between the subject matter of the appeal and whether there is a subsequent appeal to the circuit court. Again, we classify observations according to whether the subject of the appeal fell into one of the four most frequently occurring subject matter categories. For those observations involving subsequent appeal to the circuit court, approximately 62% involved a top subject matter category. For those observations without circuit court review, approximately 56% involved a top subject matter category. Applying a chi-square test with one degree of freedom, we found no statistically significant relationship (p = 0.475) between the subject matter of the appeal and subsequent appeal to the circuit court.

Finally, we found that courts of appeals affirm district courts in BAP circuits at a rate similar to that of their counterparts in non-BAP circuits. In the first-tier database, there were 77 observations for which there was a subsequent appeal to the court of appeals. The subsequent history for 10 of those observations, however, already existed in the second-tier database (i.e., the circuit court opinion from the second-tier database reviewed an opinion from the first-tier database). When combining the 67 unique observations from the first-tier database involving a subsequent appeal to the court of appeals with the 170 observations in the second-tier database, courts of appeals partly or fully affirmed district courts in BAP circuits approximately 77% of the time and partly or fully affirmed district courts in non-BAP circuits approximately 71% of the time. Bivariate analysis confirms that no statistically significant difference exists between the rate at which courts of appeals partly or fully affirmed district courts from BAP circuits and district courts from non-BAP circuits (chi-squared = 0.9094, df = 1, p = 0.340). Furthermore, if one considers only those observations where the court of appeals fully affirmed district courts, the affirmance rates in BAP and non-BAP circuits are similar. The circuit court affirmance rate of district court dispositions in BAP circuits was approximately 67% in comparison to 65% in non-BAP circuits. Bivariate analysis confirms that this difference is not statistically significant (chi-squared = 0.1419, df = 1, p = 0.706).

132. With respect to citations, if there is a forum-selection bias, then the BAPs are not deciding some categories of cases—and, perhaps, certain issues—that the district courts are. This logically should translate into an increase in citations to district court opinions as compared to BAP opinions, since other courts facing such issues and wishing to include citations will have no opportunity to cite to any BAP opinions. Yet, as we discuss below, our data analyses generally show that BAP citations are favored. In short, if there is a selection bias, then our statistical analyses, if anything, understate the extent to which BAP citations are favored.
2. Variables of Interest

Recall that we sought to test our broad inquiry into the perceived quality of appellate review by focusing on (1) how two distinct appellate courts in the bankruptcy judicial system—the BAPs and district courts—perform their error-finding function and (2) how other judicial actors perceive the quality of that performance. As our hypotheses indicate, we concerned ourselves with an array of dependent variables that fall within one of two categories: (1) affirmance by the court of appeals and (2) citations by other federal courts to the appellate opinions issued by BAPs and district courts. We will discuss each category and the variables associated with each in turn.

First, we tracked the disposition rendered by the BAP or district court on appeal according to three ordered outcomes: (1) “negative” for those dispositions where the reviewing court reversed, remanded, or vacated the disposition rendered below; (2) “hybrid” for those dispositions where the reviewing court partly affirmed the disposition rendered below; and (3) “positive” for those dispositions where the reviewing court fully affirmed the disposition rendered below.133 We define circuit court affirmance in two ways: broadly and narrowly. Broadly defined, affirmance occurred when the circuit court either partly or fully affirmed the disposition rendered by the first-tier appellate court (i.e., those observations with hybrid or positive outcomes).134 Narrowly defined, affirmance occurred only when the circuit court fully affirmed the disposition rendered by the first-tier appellate court (i.e., those observations with positive outcomes).135 Second, in order to document citation data to the opinions in our databases, we relied upon KeyCite, West’s citation research service.136 We documented for each first-tier level opinion all

133. For the frequency of the dispositions rendered on appeal in first-tier and second-tier level opinions, see infra Appendix tbl.2.
134. As set forth below, we denominate this variable “Affirmance.” See infra text accompanying notes 150–151.
135. As set forth below, we denominate this variable “Full Affirmance.” See id.
136. KeyCite organizes citing references for a case by segregating negative citing references from positive citing references. KeyCite further organizes negative and positive citing references according to the depth of treatment given by the citing reference to the cited opinion. Four categories exist for the depth of treatment provided by the citing reference: (1) “examined,” indicating that the citing reference contains an extended discussion of the cited opinion, usually more than a printed page of text; (2) “discussed,” indicating that the citing reference contains a substantial discussion of the cited opinion, usually more than a paragraph but less than a printed page; (3) “cited,” indicating that the citing reference contains some discussion of the cited opinion, usually less than a paragraph; and (4) “mentioned,” indicating that the citing reference
positive citations made to it by any federal court—aside from those
citations made in connection with the direct appellate history of the
opinion—during the five-year period following the date that the
opinion was issued. Pursuant to these criteria, approximately 75% of
the first-tier appellate opinions had citing references. We further
documented (1) citations by type of court, (2) citations by depth of
treatment, (3) citations directly quoting the cited opinion, and (4) the
immediacy with which first-tier appellate opinions were cited.\textsuperscript{137}

The major explanatory variables (i.e., independent variables) in
the databases include (1) whether the BAP or district court heard the
initial appeal, (2) whether the appellant was solely the debtor in
whose case the appeal arose, (3) whether the appellee was solely the
debtor in whose case the appeal arose, (4) whether the appeal arose in
the context of a case filed under Chapter 7 of the Bankruptcy Code,
(5) whether the bankruptcy case in which the appeal arose was filed
by an individual, (6) whether the type of dispute proceeding within
which the appeal arose was an adversary proceeding or contested
matter, and (7) the subject matter of the appeal.

\textbf{B. Bivariate Descriptive Statistics}

Our primary interest lies in the statistical relationship
between the identity of the first-tier appellate court and various
dependent variables: (1) affirmance by the court of appeals, (2) the
number of positive federal court citations to the opinion issued by the
first-tier appellate court, (3) the depth of treatment given to first-tier
appellate opinions when positively cited by other federal courts, (4)
direct quotation of the first-tier appellate opinion by positive citing
references, and (5) the immediacy with which the first-tier appellate
opinion is positively cited. By searching for a statistically significant
relationship between the identity of the first-tier appellate court and
each of these dependent variables, we can look for those relationships
warranting further inquiry through regression analysis that will
confirm the existence of the relationship when controlling for other
factors.

Hypothesis 1 posits that courts of appeals more likely will
uphold the dispositions rendered on appeal by BAPs than those
rendered by district courts. Our data support this hypothesis. In the

\textsuperscript{137} For citation data for those first-tier appellate opinions with positive citing references,
see infra Appendix tbl.3.
first-tier database, there were 77 observations for which there was a subsequent appeal to the court of appeals. The subsequent history for 10 of those observations, however, already existed in the second-tier database (i.e., the circuit court opinion from the second-tier database reviewed an opinion from the first-tier database). Combining the 67 unique observations in the first-tier database involving a subsequent appeal to the court of appeals with the 170 observations in the second-tier database, we generated a database of 237 observations for purposes of analyzing circuit court affirmance rates of first-tier appellate dispositions (the “affirmance database”). When defining affirmance broadly to include those dispositions where the circuit court either partly or fully affirmed the first-tier appellate court, the court of appeals affirmed BAPs approximately 91% of the time as opposed to 74% for district courts. If no association had existed between the type of first-tier appellate court to have initially decided the appeal and the disposition rendered on subsequent appeal by the court of appeals, we would have expected to see first-tier appellate dispositions partly or fully affirmed by the court of appeals approximately 78% of the time. Our analysis confirms that there is less than a 0.01 probability that random chance alone would have yielded a difference as large as the one witnessed. Similarly, when defining affirmance narrowly to include only those dispositions where the circuit court fully affirmed the first-tier appellate court, the court of appeals affirmed BAPs approximately 81% of the time as opposed to 66% for district courts. If no association had existed between the

138. Of the 77 observations in the first-tier database for which there was a subsequent appeal to the court of appeals, 50 were district court dispositions and 27 were BAP dispositions. As there were a total of 162 district court and 106 BAP dispositions in the first-tier database, infra Appendix tbl.1, approximately 31% of the district court dispositions and 25% of the BAP dispositions involved subsequent appeal. As our first-tier database only includes opinions that disposed of the appeal on the merits, these figures seem to be consistent with empirical evidence that has estimated that up to a third of first-tier appellate dispositions rendered on the merits have been further appealed to the court of appeals. See McKenna & Wiggins, supra note 65, at 630; see also U.S. BANKRUPTCY APPELLATE PANEL FOR THE EIGHTH CIRCUIT, STATISTICAL REPORT: JANUARY 1, 2005 – DECEMBER 31, 2005 (2005), available at http://www.ca8.uscourts.gov/newbap/stats/q4-05.pdf (documenting that approximately 30% of bankruptcy appeals in the Eighth Circuit in 2005 were taken to the U.S. Court of Appeals).

140. The 81% full affirmation rate of BAP dispositions by circuit courts approximates the rate at which the U.S. Court of Appeals for the Tenth Circuit fully affirmed merit-based BAP
type of first-tier appellate court and circuit court affirmand, we would have expected to see first-tier appellate dispositions fully affirmed by the court of appeals approximately 70% of the time. Our analysis confirms that there is less than a 0.05 probability that random chance alone would have yielded a difference as large as the one witnessed.141

Hypotheses 2 through 7 generally predict that, with the exception of district courts, other federal courts will positively cite to BAP opinions more than they positively cite to district court opinions. For district courts, we hypothesize that they will cite more often to district court opinions than BAP opinions. Finally, we predict that extracircuit citations to BAP opinions will exceed extracircuit citations to district court opinions. As an initial matter, BAP opinions had a higher propensity to be positively cited by other federal courts than district court opinions. Approximately 91% of the BAP opinions in the first-tier database had been positively cited by federal courts, whereas slightly less than two-thirds (65%) of the district court opinions had received similar treatment. In the absence of a relationship between the type of first-tier appellate opinion and positive citation thereto by other federal courts, we would have expected to see approximately three-quarters (75%) of the first-tier appellate opinions positively cited. Our analysis confirms that there is less than a 0.0001 probability that random chance alone would have yielded a difference as large as the one witnessed. It would thus appear that the type of first-tier appellate opinion has some influence on a federal court’s decision to cite that opinion.

We can further elaborate on this relationship by examining the number of citing references to the opinions according to the type of federal court making the citing reference. We note that 53% of the observations in the first-tier database that have positive citing references are district court opinions.142 Assuming a random, or at

---

141. For the details of these results, see infra Appendix tbl.4.

142. The first-tier database contained 202 observations in which a federal court positively cited to the opinion issued by the first-tier appellate court. In conducting our bivariate analyses, we exclude extreme outliers (i.e., those observations involving extreme values in the tails of the distribution of the positive citing reference data). We define an extreme outlier to be any observation with a total number of positive citations that falls above the third quartile of the positive citing reference data (7 citations) by more than three times the interquartile range for such data (5 citations). See infra Appendix tbl.3 (describing distribution of positive citing references to first-tier opinions). Accordingly, we excluded any observations with more than 22 positive citing references. Pursuant to this measure, we eliminated 2 observations from our analysis—both BAP opinions—leaving us with a total of 200 observations for analysis. Accordingly, approximately 99% of the first-tier appellate opinions in our sample that were cited...
least somewhat random, distribution of issues and factual settings, we
would expect citation rates to favor district court opinions slightly.\footnote{143}
Our data, however, generally show that citation rates favor BAP
opinions. Specifically, we find strong differences between the BAP and
district court samples that are statistically significant at both the
mean and the median. For example, a BAP opinion that was positively
cited had, on average, approximately 7 citations by other federal
courts, whereas a district court opinion averaged approximately 3
citations. Furthermore, by disaggregating our citation data according
to the type of federal court that cited the first-tier appellate opinion,
we find that the BAP opinions in our study had a statistically
significantly greater number of citing references by courts of appeals,
BAPs, and bankruptcy courts than did district court opinions. On the
other hand, district court opinions had a statistically significantly
greater number of citing references by other district courts than did
BAP opinions. Finally, the data indicate that extracircuit federal
courts cited more to BAP opinions than to district court opinions and
that the difference is statistically significant. Some of these results are
illustrated below in Figure 2.\footnote{144}

\begin{quote}
positively by other federal courts are included in our bivariate analyses of the citing reference
data.
\end{quote}

\footnote{143. Cf. Merryman, \textit{Toward a Theory of Citations, supra} note 104, at 403 (arguing that the
larger number of citations by the California Supreme Court to opinions issued by the courts of
New York State may be due to the large case literature arising out of New York).

144. For a full accounting of these results, see \textit{infra} Appendix tbl.5.}
Additional evidence of the perceived correctness of the first-tier appellate opinions can be gleaned from examining the depth of treatment provided to those opinions by the federal courts that cited to them. Hypothesis 8 predicts that the citing references to BAP opinions will have afforded a greater depth of treatment than district court opinions. Our data generally support this hypothesis. We find that, at both the median and the mean, BAP opinions had a statistically significant higher number of citing references by other federal courts that cited (i.e., provided discussion of less than a paragraph) and discussed (i.e., provided discussion of more than a paragraph but less than a printed page) the opinion. 145 We also find that, at the median, BAP opinions had a statistically significant higher number of citing references by other federal courts that mentioned the opinion (i.e., contained a brief reference to the cited opinion, usually in a string

145. For purposes of this analysis, we once again exclude extreme outliers according to the criteria discussed in supra note 142.
We do not find, however, either at the median or the mean, any association between the type of first-tier appellate opinion and the number of positive citing references that examine the opinion (i.e., contain an extended discussion of the cited opinion usually more than a printed page of text). Figure 3 illustrates some of these results.146

We tracked the number of citing references that directly quoted the first-tier appellate opinion as yet another metric for evaluating the perceived correctness of the first-tier appellate opinions in our study. First, we find evidence to support our hypothesis that a greater likelihood exists that positive federal citing references will have quoted BAP opinions as opposed to district court opinions. Approximately 65% of the federal courts that positively cited BAP opinions also directly quoted those opinions, whereas only 38% of district court opinions with positive federal citing references were directly quoted. If no relationship existed between the type of first-tier

146. For a full accounting of these results, see infra Appendix tbl.5.
appellate opinion and positive direct quotation thereto by other federal courts, we would have expected to see slightly more than half (51%) of the first-tier appellate opinions to have been quoted directly. Our analysis confirms that there is less than a 0.0001 probability that random chance alone would have yielded a difference as large as this, thus indicating a statistically significant association between the type of first-tier appellate opinion and a federal court’s decision to quote the opinion directly when positively citing to it. Furthermore, we observe that, on average, approximately 1.5 of the positive citing references to BAP opinions directly quote such opinions as opposed to only 0.58 of the positive citing references to district court opinions. Also, whereas 65% of the positively cited BAP opinions have at least one directly quoting citing reference, only 39% of the positively cited district court opinions did so. These differences are highly statistically significant and further support our contention that positive federal citing references will have directly quoted BAP opinions more frequently than district court opinions.147

 Finally, the immediacy with which a federal court cites to such an opinion serves as yet another indicator of its perceived quality. Accordingly, we consider the period of time for which it took a first-tier appellate opinion to be positively cited by a federal court for the first time.148 Our data show that, for the group of positively cited first-tier appellate opinions, a BAP opinion would receive its first positive citing reference by another federal court, on average, within approximately 10 months (306 days), while it took nearly twice as long—approximately 17 months (533 days)—for a district court opinion. Moreover, slightly more than half (51%) of the BAP opinions from this group received their first positive citation within approximately a 6-month period. This starkly contrasts with district court opinions, only about a quarter (24%) of which received their first positive citation within the same period of time. These highly statistically significant differences indicate that the type of first-tier appellate opinion has

147. For purposes of these analyses, we excluded extreme outliers according to the criteria discussed in supra note 142. For a full accounting of these results, see infra Appendix tbl.5.

148. We might assume that an opinion that comprehensively and effectively addresses an unresolved or debated issue of law that has been repeatedly litigated not only will be heavily cited, but also will be cited more quickly. Thus, for purposes of this analysis, we exclude the extreme outliers we identified with respect to total number of positive citing references. See supra note 142. We further sought to identify whether there were any extreme outliers in terms of the number of days it took for the first-tier appellate opinions to be cited. In this instance, we define an extreme outlier to be any observation with a total number of days that falls above the third quartile of the immediacy data (638 days) by more than 3 times the interquartile range for such data (520.5 days). On the basis of these parameters, there were no additional extreme outliers.
some association with the time within which the opinion will garner its first positive citation by another federal court.\textsuperscript{149}

In summary, based on the affirmance rates of courts of appeals on subsequent review of BAP and district court opinions, we find that courts of appeals perceive BAPs to provide a better quality of appellate review than district courts. Moreover, based on citations to the opinions issued by BAPs and district courts, we find strong evidence that most nonreviewing federal courts perceive the quality of BAP opinions to be better. We now look to confirm whether these associations will persist when controlling for other potential explanatory variables and, if so, we attempt to measure the strength of such associations.

\textit{C. Regression Analyses}

Here, we seek to provide a more comprehensive analysis of the perceived quality of appellate review by constructing a series of regression models that will test whether the statistically significant relationships we identified in Part III.B persist when controlling for the independent variables discussed in Part III.A.

\textbf{1. Circuit Court Affirmance}

For the 237 observations in the affirmance database,\textsuperscript{150} we used a logistic regression model to predict the binary dependent variable of circuit court affirmance (no affirmance coded 0 and affirmance coded 1), both broadly and narrowly defined (respectively, Affirmance and Full Affirmance),\textsuperscript{151} based on the following independent variables:

\begin{itemize}
  \item whether the first-tier appellate court was a district court (coded 0) or a BAP (coded 1) (\textit{Court});
  \item whether the appeal arose within the context of an adversary proceeding (coded 0) or a contested matter (coded 1) (\textit{Dispute Type});
  \item the fiscal year in which the first-tier appellate court issued its opinion (for which we created three indicator variables with the response categories 0 for those opinions issued outside of the
\end{itemize}

\textsuperscript{149} For a full accounting of these results, see infra Appendix tbl.5.
\textsuperscript{150} See supra Part III.A.2.
\textsuperscript{151} See supra text accompanying notes 134–135.
fiscal year in question and 1 for those opinions issued during the fiscal year in question) (Fiscal Year); 152

whether the first-tier appellate court had published its disposition (negative responses coded 0 and positive responses coded 1) (Published);

whether the only party to appeal to the first-tier level court was the debtor (negative responses coded 0 and positive responses coded 1) (Appellant);

whether the debtor was the only party appearing as an appellee at the first-tier level of review (negative responses coded 0 and positive responses coded 1) (Appellee);

whether the appeal arose in the context of a Chapter 7 case (negative responses coded 0 and positive responses coded 1) (Chapter 7);

whether the bankruptcy case in which the appeal arose was that of an individual debtor (negative responses coded 0 and positive responses coded 1) (Debtor Type); and

whether the subject of the appeal could be classified as falling into one of the four most frequently occurring subjects of appeal heard by first-tier appellate courts for which there was subsequent appeal to the court of appeals (negative responses coded 0 and positive responses coded 1) (Subject).153

According to the model, even when controlling for other potential explanatory variables, the type of first-tier appellate court to have initially determined the appeal remains a statistically significant predictor of Affirmance and Full Affirmance by the court of appeals.154 The model indicates that the shift from the district court to the BAP as the first-tier appellate court made the odds of Affirmance 3.95 [1.41, 11.07] times higher and the odds of Full Affirmance 2.54 [1.12, 5.67] times higher.

152. The opinions in the database were issued during one of three government fiscal years—1998, 1999, or 2000. See supra note 122 and accompanying text. The reference category was first-tier opinions issued during the 2000 fiscal year and was accordingly excluded from the model.

153. The four most frequently occurring subjects were matters relating to discharge (24%), multiple subjects (17%), avoiding powers (10%), and procedure/jurisdiction (9%).

154. Both the Court and Published variables are significant predictors of Affirmance and Full Affirmance. The Appellant, Appellee, and Subject variables are significant predictors of Full Affirmance (but not Affirmance). For detailed results from this regression model, see infra Appendix tbl.6.
5.74] times higher.\textsuperscript{155} Put another way, holding all other variables constant, a first-tier appellate disposition rendered by a BAP increased the odds of Affirmance by 295\% \textsuperscript{[41, 1007]} and Full Affirmance by 154\% \textsuperscript{[12, 474]}.

It is helpful to elucidate these findings in terms of predicted probabilities. Using the actual values of all of the independent variables included in the model, we can calculate the predicted probability of circuit court affirmance for the 237 first-tier appellate dispositions upon which the model is based. In Figures 4 and 5 below, we present the predicted probabilities for Affirmance and Full Affirmance, respectively, of the actual observations in our regression model through use of a histogram that displays the distribution of those probabilities for district court dispositions and BAP dispositions separately. The width of each bar represents a specific interval of predicted probability of affirmance, and the height of each bar represents the percentage of dispositions that fall within that interval. For any observation with a predicted probability of over 50\% (i.e., greater than 0.5), the model assigned the positive outcome of circuit court affirmance.

\textsuperscript{155} When performing inference, we implement the recommended practice of conveying levels of uncertainty by using the notation $[\#, \#]$ to indicate the lower and upper bounds of the 95\% confidence interval around our estimates. See Lee Epstein, Andrew D. Martin & Matthew M. Schneider, \textit{On the Effective Communication of the Results of Empirical Studies, Part I}, 59 Vand. L. Rev. 1811, 1835–37 (2006).
First, we find that, when holding other variables at their mean, a BAP disposition is predicted to have a 93% [86, 99] chance of being either partly or fully affirmed by the court of appeals in contrast to 77% [70, 84] for district court dispositions. Thus, when holding other variables at their mean, the likelihood of partial or full affirmance by the court of appeals is predicted to increase by 16 [7, 25] percentage points when it reviews BAP dispositions. Second, we find that, when holding other variables at their mean, a BAP disposition is predicted to have an 85% [76, 95] chance of being fully affirmed by the court of appeals in contrast to 69% [62, 77] for district court dispositions. Thus, when holding other variables at their mean, the likelihood of full affirmance by the court of appeals is similarly predicted to increase by 16 [4, 28] percentage points when it reviews BAP dispositions. These findings support our hypothesis that courts of appeals will more likely uphold the dispositions rendered by BAPs than those rendered by district courts.
2. Positive Citing References by Other Federal Courts

To further explore (1) the decision of federal courts to cite positively to the opinions issued by first-tier appellate courts, (2) the extent to which they do so, (3) the manner in which they do so, and (4) the immediacy with which they do so, we construct a series of binary logistic regression models as well as various count regression models (e.g., negative binomial and Poisson). First, we examine whether the association between the identity of the first-tier appellate court and positive citation to its opinion persists when controlling for other factors. For all 286 observations in the first-tier database, we use a binary logistic regression model to predict whether a federal court will have cited positively to the first-tier appellate opinion (coding opinions with no positive citations as 0 and coding opinions with at least one positive citation as 1) based on the following independent variables: (1) Court; (2) whether the first-tier appellate court fully affirmed the disposition rendered by the bankruptcy court (negative responses
coded 0 and positive responses coded 1) (First-Tier Full Affirmance); (3) Published; (4) Appellant; (5) Appellee; (6) Chapter 7; (7) Debtor Type; (8) Dispute Type; (9) Subject; (10) whether the first-tier court’s disposition was subsequently appealed to the court of appeals (negative responses coded 0 and positive responses coded 1) (Subsequent Appeal); and (11) Fiscal Year.

The model identifies the type of first-tier appellate court to have initially determined the appeal as a statistically significant predictor of whether the court’s opinion will have been positively cited by another federal court. Figure 6 below illustrates the predicted probability of positive citation to the first-tier appellate opinion based on the actual values of all of the independent variables included in the model.

---

**FIGURE 6**

**PREDICTED PROBABILITIES FOR POSITIVE CITATION OF FIRST-TIER APPELLATE OPINIONS BY FEDERAL COURTS**

![Graph showing predicted probabilities for positive citation by federal courts](image)

Source: First-Tier Database

---

156. For detailed results from this regression model, see *infra* Appendix tbl.7.
We find that, when holding other variables at their mean, a BAP opinion is predicted to have a 90% [84, 97] chance of being positively cited by another federal court in contrast to 73% [65, 81] for district court opinions. Accordingly, when holding other variables at their mean, the likelihood of positive citation to a first-tier appellate opinion by another federal court is predicted to increase by 17 [7, 27] percentage points for BAP opinions. These data support our hypothesis that, if a BAP issued the first-tier appellate opinion, it will increase the chances of the opinion being positively cited by other federal courts.157

The question arises whether this association persists when analyzing the extent to which other federal courts cite to first-tier appellate opinions, whether analyzing citations in the aggregate (i.e., total number of positive citations) or disaggregated according to the type of citing federal court. To answer the question, we implement a variety of count regression models that analyze the 200 observations in the first-tier database where a federal court positively cited to the opinion issued by the BAP or district court.158 First, in order to predict the aggregate number of positive citations, we conduct a zero-truncated negative binomial regression analysis.159 We then proceed to analyze the number of positive citations by citing court type pursuant to a negative binomial regression model (with one exception).160 For both of these models, we incorporate the same independent variables from the binary logistic regression model used to predict whether the first-tier appellate opinion would be cited. Figures 7 and 8 compare (1) the observed probabilities for each value of the number of positive citations to the first-tier appellate opinions from the first-tier database with (2) the average predicted probabilities of observing those specific

157. The model also identifies the Published, Dispute, and Subject variables as significant predictors of whether the first-tier appellate opinion will have been cited by other federal courts.

158. There were actually 202 such observations. For purposes of our regression analyses, however, we eliminated 2 extreme outliers, which left 200 observations to be analyzed. See supra note 142.

159. A zero-truncated negative binomial regression model is appropriate here since (1) the aggregate number of positive citations is a count variable that is overdispersed, and (2) there are no zero values for this subset of observations (i.e., all opinions have at least one positive citing reference).

160. We ran the regression model four times to account for four different types of citing federal courts (i.e., bankruptcy court, district court, BAP, and extracircuit federal courts). In order to predict the number of citing references by courts of appeals, however, we used a Poisson regression model. When fitting a negative binomial regression model, the likelihood ratio test for alpha—the overdispersion parameter—was not significant (chi-squared = 2.52, df = 1, p = 0.056), thus indicating that the Poisson model is preferred. We do not use a zero-truncated model for any of these dependent variables since some of the observations do have zero values.
counts based on the actual values of all of the independent variables included in the fitted models.

The models indicate that a statistically significant relationship exists between the type of first-tier appellate court that issued the opinion and the total number of positive citing references as well as positive citing references by bankruptcy courts, BAPs, district courts, courts of appeals, and extracircuit federal courts. A BAP opinion increased the expected number of total positive citations over a five-year period by approximately 154% [84, 251], holding all other variables constant. If we focus on the type of citing federal court, holding all other variables at their mean, BAP opinions are predicted to receive approximately (1) 2.0 [1.1, 3.0] more bankruptcy court citations; (2) 1.3 [0.8, 1.7] more BAP citations; (3) 0.2 [0.1, 0.3] more court of appeals citations; and (4) 0.6 [0.04, 1.2] more citations by extracircuit federal courts.
FIGURE 7
COMPARISON OF OBSERVED AND PREDICTED COUNTS OF POSITIVE CITATION TO FIRST-TIER APPELLATE OPINIONS BY ALL FEDERAL COURTS AND EXTRACIRCUIT FEDERAL COURTS

Source: First-Tier Database

Electronic copy available at: https://ssrn.com/abstract=988168
These results support Hypotheses 2B, 3, 4, 5, and 7. We also find that, holding all other variables at their mean, district court opinions are predicted to receive approximately 0.34 [0.03, 0.65] more district court citations than BAP opinions, thus confirming the distinction we drew in Hypothesis 6.\footnote{To predict the total number of positive district court citations to first-tier appellate opinions, we initially fitted a negative binomial regression model that included all of the independent variables in the negative binomial regression model used for the other types of citations (the full model). Although the Court variable was a statistically significant predictor in the full model, the model as a whole was not statistically significant (chi-squared = 19.21, df = 12, \( p = 0.0836 \)). Accordingly, using a backward-selection stepwise regression, we fitted a partial model that only included the Court, Debtor, Subject, and Fiscal Year variables. This partial model was statistically significant (chi-squared = 16.70, df = 5, \( p = 0.0051 \)), and the Court variable continued to be a statistically significant predictor \( (p = 0.032) \).}

Overall, the bulk of our evidence suggests that other actors within the bankruptcy judicial system perceived BAPs to provide a better quality of appellate review than district courts.\footnote{For detailed results from these regression models, see \textit{infra} Appendix tbl.8.}
Using the same negative binomial regression model we used to predict the extent to which federal courts would cite to the first-tier appellate opinions, we find limited results for whether the type of first-tier appellate opinion will be a statistically significant predictor of the depth of treatment provided to the opinion by the citing federal court when controlling for other factors. Again, when holding all other variables at their mean, we find that BAP opinions are predicted to have a statistically significant higher number of citing references by other federal courts that (1) provided discussion of less than a paragraph but more than a brief reference to the cited opinion—approximately 2.96 [1.99, 3.92] more citing references of this type—and (2) provided discussion of more than a paragraph but less than a printed page of the opinion—approximately 0.39 [0.09, 0.68] more citing references of this type. On the other hand, we find no statistically significant relationship between the type of first-tier appellate court that issued the opinion and the number of citing references that either mentioned the opinion (i.e., contained a brief reference to the cited opinion, usually in a string citation) or examined the opinion (i.e., contained an extended discussion of the cited opinion usually more than a printed page of text).

Including the same observations and independent variables from the regression models we used to predict the extent of citation and depth of treatment by citing references, we predict through binary logistic regression the tendency of first-tier appellate opinions to be directly quoted by federal courts that positively cite to those opinions. We find that, when holding other variables at their mean, a BAP opinion is predicted to have a 64% [53, 75] chance of being directly

163. In one instance, we do not use a negative binomial regression model. In order to predict the number of citing references that examined the first-tier appellate opinion (i.e., an opinion that contains an extended discussion of the cited opinion usually more than a printed page of text), we used a Poisson regression model since the values for this dependent variable were not overdispersed. When using a negative binomial model, the likelihood ratio test for alpha—the overdispersion parameter—was not significant (chi-squared = 0.0019, df = 1, \( p = 0.483 \)), thus indicating that the Poisson model is preferred.

164. To predict the total number of positive citations that provided discussion of more than a paragraph but less than a printed page of the opinion, we initially fitted a negative binomial regression model that included all of the independent variables included in the negative binomial regression model used for the other types of citations (the full model). Although the Court variable was a statistically significant predictor in the full model, the model as a whole was not statistically significant (chi-squared = 15.41, df = 12, \( p = 0.2200 \)). Accordingly, using a backward-selection stepwise regression, we fitted a partial model that only included the Court and Subject variables. This partial model was statistically significant (chi-squared = 9.67, df = 2, \( p = 0.0060 \)), and the Court variable continued to be a statistically significant predictor (\( p = 0.008 \)).

165. For detailed results from this regression model, see infra Appendix tbl.9.
quoted in contrast to 40% [29, 50] for a district court opinion.\textsuperscript{166} Thus, when holding other variables at their mean, the likelihood of direct quotation of a first-tier appellate opinion by a citing federal court is predicted to increase by 25 [9, 40] percentage points when the court cites to a BAP opinion. We present the distribution of predicted probabilities for direct quotation (based on the actual values of all of the independent variables included in the model) in Figure 9 below.

\textbf{FIGURE 9}

\textbf{PREDICTED PROBABILITIES FOR DIRECT QUOTATION OF FIRST-TIER APPELLATE OPINIONS BY CITING FEDERAL COURTS}

\begin{figure}
\centering
\includegraphics[width=\textwidth]{predicted_probabilities}
\end{figure}

Moreover, if we look to the extent of direct quotation of first-tier appellate opinions, a negative binomial regression model indicates that a statistically significant relationship exists between the type of first-tier appellate court to have issued the opinion and the extent to

\textsuperscript{166} None of the other independent variables was a statistically significant predictor of direct quotation of the first-tier appellate opinion by its citing reference. For detailed results from this regression model, see \textit{infra} Appendix tbl.11.
which other federal courts directly quoted the opinion. Specifically, we find that, holding all other variables at their mean, a BAP opinion is predicted to have approximately 0.75 [0.35, 1.16] more citing references that directly quote it than a district court opinion. These findings support Hypotheses 9A and 9B.

Finally, we find support for Hypothesis 10, even when controlling for other factors. A zero-truncated negative binomial regression model indicates that the type of first-tier appellate court to have issued the opinion influenced the immediacy with which it was cited. A BAP opinion is predicted to decrease the expected number of days before a federal court first cites positively to a first-tier appellate opinion by approximately 44% [25, 58], holding all other variables constant. It would seem, therefore, that BAP opinions command the attention of other federal courts more quickly than district court opinions.

D. Interpretation of Results

Our inquiry into the perceived quality of appellate review has focused on two types of perception: (1) the manner in which courts of appeals, upon direct review, have perceived BAPs and district courts to perform their error-finding function; and (2) the manner in which other federal courts have signaled, through citation practices, their perception of the quality of appellate review provided by BAPs and district courts. We conducted our inquiry by testing a series of hypotheses predicting that BAPs, by virtue of their structural features, would be perceived to provide a quality of appellate review superior to that of their district court counterparts. In the end, our statistical analyses generate considerable evidence in support of our hypotheses. We repeatedly find a statistically significant, positive association between BAPs and various measures for the perception of the quality of appellate review. However, as statistical significance does not necessarily translate into substantive significance, we seek to give a richer account of the different ways in which our results buttress our claims.

167. The model incorporates the same independent variables and observations from the binary logistic regression model used to predict the tendency for direct quotation of first-tier appellate opinions.

168. No statistically significant relationship existed between any of the other independent variables and the number of citations that directly quoted the first-tier appellate opinion. For detailed results from this regression model, see infra Appendix tbl.9.

169. For detailed results from this regression model, see infra Appendix tbl.10.
First, consider our findings that, even when holding other variables at their mean, the likelihood of some affirmance (whether in part or in full) by the court of appeals is predicted to increase from 77% for district courts to 93% for BAPs, and that the likelihood of full affirmance by the court of appeals is predicted to increase from 69% for district courts to 85% for BAPs. Given that affirmance deference has been documented to be a major determinant of circuit court outcomes, the statistically significant difference in affirmance rates takes on added significance. While legal procedural requirements generally require a court of appeals to accord deference to a lower court’s findings of fact, the legal standard most often applicable to a lower court’s conclusions of law—de novo review—calls for no such deference. If courts of appeals affirm BAPs at a statistically significant greater rate than district courts, notwithstanding the affirmance bias created by legal review standards, our results suggest that the circuit courts perceive the BAP to perform its error-finding function better than the district court.

Second, consider our statistically significant findings that BAP opinions received higher numbers of positive citations by other federal

170. See supra Part III.C.1.
171. See CROSS, supra note 95, at 39–68.
172. A study conducted by the Federal Judicial Center found that courts of appeals fully affirmed the judgments of district courts in bankruptcy appeals approximately 73% of the time, and the study further estimated that the affirmance rates for BAP judgments would be similar. See McKenna & Wiggins, supra note 65, at 630. We conclude that our statistically significant evidence contravenes the prior understanding of outcomes in the bankruptcy appeals system.

In response to the account we have provided regarding circuit court affirmance, one might argue that courts of appeals simply prefer to reduce their workload and that they accordingly tend to defer to BAPs (even if the legal standard calls for more exacting review). Assuming, however, that the predilection toward leisure does not outweigh the desire of courts of appeals to resolve appeals correctly, then one must assume that, to the extent that courts of appeals affirm—and, on this story, defer to—BAPs more than district courts, they do so because they believe that BAPs are structurally more likely to resolve the issues correctly than are district courts. It is true that, to the extent that the courts of appeals simply defer to BAPs to a greater extent on principle (i.e., with less review of how the BAPs actually resolve particular cases), we cannot say whether the affirmance rate measures actual quality of appellate review. Even on this story, however, the affirmance rate does measure the perceived quality of appellate review.

One also might argue that courts of appeals in BAP circuits are heavily invested in the success of the BAPs given that the judicial councils in those circuits have decided to establish BAPs in the first instance, see 28 U.S.C. § 158(b)(1) (2000) (setting forth procedures for establishing a BAP), and given that the judicial councils have also selected the bankruptcy judges who will serve on the BAPs, see id. § 158(b)(3) (setting forth procedures for selecting BAP judges). The desire to legitimate the BAP as an institution, in other words, may motivate the greater tendency of courts of appeals to affirm BAPs. Insofar as review by a court of appeals is transparent, however, it is unlikely that the court would simply affirm BAP judgments and reasoning that were obviously wrong. Put another way, it seems unlikely that the desire of a court of appeals to legitimate a BAP would entirely outweigh the desire to resolve appeals correctly.
courts, BAP opinions were cited in greater depth, and BAP opinions were cited with greater immediacy. We noted above that citations rates are most relevant and most informative in the absence of a stare decisis obligation. Accordingly, we find that our results regarding the citation practices of courts of appeals and extracircuit federal courts merit particular attention.

At first blush, one might not consider substantively significant our statistically significant finding that, when holding other variables at their mean, BAP opinions are predicted to receive approximately 0.2 more citations by courts of appeals. Placed in its proper context, however, this finding takes on new light. As an initial matter, courts of appeals were incredibly parsimonious in their citing of first-tier appellate opinions. Specifically, 82% of the first-tier appellate opinions did not receive any circuit court citations, thus making any amount of citation by the courts of appeals impressive. Furthermore, we estimate pursuant to our regression analysis that the rate of citation over a five-year period to BAP opinions by courts of appeals is 2.33 [1.30, 4.21] times greater than for district court opinions. These findings confirm anecdotal evidence reported by the Federal Judicial Center that circuit judges perceive BAP opinions to be of a higher quality than district court opinions. Thus, although the size of the statistically significant effect we witness with respect to circuit court citations appears small, we interpret it to have substantive significance. Finally, we uncovered statistically significant evidence to support our hypothesis that extracircuit federal courts would positively cite with greater frequency to BAP opinions—specifically, a rate predicted to be 1.45 [1.03, 2.03] times greater than that for district court opinions. In light of “the dearth of binding precedent [on questions of substantive bankruptcy law] from the courts of appeals or the Supreme Court,” one might interpret the extracircuit favoritism of BAP opinions over district court opinions as the next-best source of authority.

When we consider these findings in concert with the rest of our findings on citation practices, we conclude that there exists strong support for the notion that, in a variety of ways, other judicial actors

---

173. See supra notes 106–107 and accompanying text.
174. See infra Appendix tbl.8.
175. See McKenna & Wiggins, supra note 65, at 678 (“There is anecdotal evidence that circuit judges find the BAP decisions they review better reasoned and the cases better prepared for review than decisions from the district courts, and that this impression is independent of the likelihood of affirmation or reversal.” (emphasis added)).
176. See infra Appendix tbl.8.
177. See McKenna & Wiggins, supra note 65, at 628.
in the bankruptcy appeals process perceive BAPs to provide a better quality of appellate review than district courts. These conclusions provide strong validation to commentators who have theorized about the ideal attributes of appellate review. To the extent that courts in fact strive to resolve cases correctly, the findings suggest that BAPs in fact offer higher quality appellate review than do district courts. That conclusion, in turn, has important ramifications for policymakers. It would seem desirable for policymakers to introduce more multimember appellate tribunals staffed by judges with particular expertise in the subject matter of the appeals.178

It is important to emphasize again that those conclusions clearly result only if courts in fact strive to reach correct resolution of cases and issues. That is a question on which our data do not and cannot shed light. It may be the case that, partly as a result of theoreticians’ writings, courts favor BAPs over district courts not because they truly conclude that BAPs are correct more often, but rather because they simply believe (without truly examining) that BAPs are correct, which in turn inclines them simply to affirm the conclusions of BAPs. If so, the lesson for policymakers is murkier.

178. See, e.g., id. at 634:

[U]sers of the complex bankruptcy system probably want precedent not just settled, but settled right . . . . If early (and in the Ninth Circuit, not so early) impressions about the quality of work by the bankruptcy appellate panels hold up, the dual needs for binding authority and substantive correctness . . . argue for some sort of a dual or hybrid system involving bankruptcy appellate panels in some form.

The benefits of establishing such tribunals may impose various costs, although they may be minimized depending on the manner in which such tribunals are integrated within existing judicial operations. See, e.g., id. at 629; Bankruptcy Appeals, Lawyers Wary of New System Begun This Month, N.Y.L.J., July 11, 1996, at 5 (“Steven Flanders, the Second Circuit Executive, though, while noting that the BAPs represent a ‘major institutional change’ for the circuit, believes the costs will be manageable. Mr. Flanders indicated that the calendaring of appeals will be integrated into the circuit clerk’s office . . . .”). From the perspective of litigants, a cost of particular concern would be that of disposition time. In the bankruptcy appeals context, however, preliminary evidence tentatively suggests that BAPs appear to have reduced such costs. A study by the Federal Judicial Center reported that, “[i]n most circuits, the overall mean and median disposition times for BAPs are lower than the national figure for bankruptcy appeals to the district courts, but in most circuits they are based on a rather small number of cases, which limits the conclusions to be drawn from the figures.” McKenna & Wiggins, supra note 65, at 661.

We emphasize that our findings do not speak to whether it is more desirable to have many such tribunals—as is the case with BAPs—or just one national tribunal—as is the case, for example, with the United States Court of Appeals for the Federal Circuit for patent appeals. That issue would seem to turn largely on the importance of having an intermediate appellate tribunal announce legal rules with national uniformity. See, e.g., id. at 649.
CONCLUSION

In this Article, we have shown that, in different ways, federal courts have expressed a general preference for the quality of appellate review afforded by BAPs as opposed to district courts. On the hardly implausible assumption that courts in fact strive to resolve cases and issues correctly, this finding tends to validate theoreticians’ claims about the ideal attributes of appellate review, because BAPs, more so than district courts, tend to feature those attributes. Upon the same assumption, this finding also should prompt policymakers to introduce more appellate tribunals with these attributes—specifically, multimember panels whose members enjoy an expertise in the types of matters likely to fill up the docket of the tribunals.

We believe that future research in the area will offer even more insights. We intend to continue our exploration by refining our consideration of issues that come before courts. Perhaps, for example, some issues lend themselves more to solution by expert panels than do others. We also hope to consider the effect of competition between appellate tribunals, such as the one that exists between BAPs and district courts in the bankruptcy appeals context.

a Zero-truncated negative binomial regression model.
b Negative binomial regression model.
c We have fitted a negative binomial regression model that does not include all of the independent variables in the table for the reasons set forth in supra note 161.
d Poisson regression model. When fitting a negative binomial regression model, the likelihood ratio test for alpha—the overdispersion parameter—was not significant (chi-squared = 2.52, df = 1, p = 0.056), thus indicating that the Poisson model is preferred.
