Wealth-Building for All Children: Convergence and Evidence to Support a Nationwide Policy

Jin Huang, Trina R. Shanks, Margaret M. Clancy, William Elliott III, and Michael Sherraden

Policy scholars and policymakers have grown increasingly concerned about wealth inequality in the United States, and many see a potential remedy in early-life wealth-building policies. Variations of such policies have been proposed since the early 1990s, beginning with Child Development Accounts (CDAs) in 1991. A proposal for Baby Bonds came in 2010. CDAs are specialized investment accounts designed to promote wealth accumulation for all children, with a specific focus on economically disadvantaged and minoritized children, and Baby Bonds aim to target children from low-wealth or low-income families with publicly funded trust accounts. In the most recent federal legislation (Box 1), the proposals for CDAs and Baby Bonds have much in common.

Federal early-life wealth-building policy requires an efficient, effective, scalable, and sustainable account structure, which is fundamental for ensuring that the policy will reach all eligible beneficiaries, manage funds successfully, accumulate assets, and distribute those assets effectively. The policy structure and delivery mechanisms matter.

As the federal policy proposals for early wealth building have evolved over time, they have increasingly reflected recognition that prospects for adoption depend upon whether the policy will reach all eligible beneficiaries, advance multiple policy goals, and manage accumulated assets effectively. At this writing, two early wealth-building proposals are before the Congress: the 401 Kids Savings Account Act and the American Opportunity Accounts Act (see Box 1).

Convergence on Policy Principles and Design for Federal Early-Life Wealth Building

Policymakers and researchers gathered to discuss wealth-building policy at a November 2023 meeting hosted by the Urban Institute. Policy views on both CDAs and Baby Bonds were represented at the meeting. The discussants arrived at broad agreement on a number of key principles for policy design and delivery.

BOX 1

FEDERAL LEGISLATION FOR WEALTH BUILDING FOR ALL CHILDREN

The 401Kids Savings Account Act of 2024
S. 3716 | H.R. 7162

U.S. Senator Bob Casey has newly revised and renamed federal legislation aimed at establishing a nationwide children’s account policy. This initiative is crafted to empower children across the country, especially those from disadvantaged backgrounds, with a pathway to build assets and wealth for future investments such as funding higher education. The legislation would create asset-building accounts for all children in the United States.

The American Opportunity Accounts Act
S. 441 | H.R. 1041

U.S. Senator Cory Booker and U.S. Representative Ayanna Pressley have reintroduced this Act, which aims to establish a federally funded account for every child to promote economic opportunity and address the racial-wealth gap. This legislation provides a $1,000 seed savings account at birth, with additional deposits annually based on family income, and allows access to funds for purposes such as homeownership or education at age 18.
A strong consensus bodes well for future federal-policy development. These six policy principles, along with the policy-design features that express them, are informed and reinforced by extensive research and policies on asset building for children. A well-structured policy framework is critical for scalable and sustainable early-life wealth-building policies. A well-designed policy would include all children, benefit from existing federal and state infrastructures, and achieve economies of scale. Local child account programs by themselves—no matter how numerous—do not serve all children and are not cost effective. CDAs are more sustainable on an efficient policy platform. This is perhaps apparent in how CDAs are expanding—nearly all of the growth is on a policy platform similar to the model in SEED OK. A universal CDA policy structure is not in conflict with—but instead complementary to—local CDA activities.

Much of the evidence on these matters comes from SEED for Oklahoma Kids (SEED OK), a large social experiment on early wealth building. Planned in the early 2000s, SEED OK launched in 2007. Among the reasons for choosing Oklahoma as the site for the experiment were the relatively sizable subpopulations of color (African Americans, Hispanics, and Native Americans), and SEED OK researchers oversampled these subpopulations. This was important because wealth accumulation varies greatly by race in the United States and CDAs are designed to help to correct that disparity. SEED OK is a rigorous experiment with sampling in a full population. The resulting evidence is therefore robust and influential (Box 3).

Table 1 summarizes evidence from SEED OK on the six policy principles and the associated design features. As the table’s consensus on policy principles and design features for early-life wealth-building federal policies (see Box 2). This strong consensus bodes well for future federal-policy development.

**Box 2**

**Agreement on Principles for Federal Policy on Early-Life Wealth Building**

In late 2023, the Urban Institute hosted a convening of diverse researchers and policymakers, who debated and then agreed upon a set of six principles to be included in federal wealth-building policy:

- **Start at the beginning**
- **Ensure inclusion and reduce wealth inequities**
- **Make real investments**
- **Structure, scale, and transparency**
- **Ease of access and use**
- **Support vertical connections**

**Box 3**

**The Seed for Oklahoma Kids Policy Experiment**

In 2007, the Center for Social Development (CSD) embarked on a major, long-term experiment to test a design for a Child Development Account (CDA) policy. Through the experiment, SEED OK researchers hoped to specify a policy structure that would be efficient, effective, scalable, and sustainable. After careful study, CSD began a partnership with a competitively chosen state to use a transformed college savings plan (529 plan) as the platform for the CDA policy.

Currently in its 17th year, the SEED OK experiment follows a representative cohort of Oklahoma children drawn from infants born in the state in 2007. The study randomly selected 7,328 children, and the mothers of 2,704 of those children agreed to participate. They were then randomly assigned into the treatment (n = 1,358) or control group (n = 1,346). The CDA in SEED OK features 10 design components: universal eligibility, automatic enrollment, at-birth start, automatic initial deposit, automatic progressive subsidy, centralized savings plan, investment growth potential, targeted investment options, restricted withdrawals, and means-tested public benefit exclusion. These principles and design features have substantial empirical footing.

The robust evidence from SEED OK has spurred several similar state-level CDA policies, which now account for over 95% of the child wealth-building accounts in the United States. More than five million children have assets in such accounts.

contents document, the principles and features are practical, achievable, effective, and sustainable.

The evidence summarized in the table reveals considerable alignment between the CDA policy in SEED OK and the federal early-life wealth-building proposals. The principles are not just ideas; they are achievable and also effective in operation. The SEED OK experiment has demonstrated that these six principles and the associated features can serve a full population of children. Several U.S. states have adopted CDA policies. All of them, as in SEED OK, use a transformed 529 plan as the policy platform.10

Future Policy

The central point in this brief is that various wealth-building initiatives share similar purposes and design features.11 Moreover, they share the six identified policy principles on which a collective consensus has emerged among experts. Together, the principles represent a shared vision for future federal policies aimed at early-life wealth building.

The SEED OK experiment has tested a model for universal, at-birth asset-building policy, identifying an effective and sustainable delivery system.12 The resulting evidence indicates the model’s potential in future wealth-building policy for all children. To put this another way, policy ideas are necessary but, in themselves, not sufficient. Evidence on a policy’s potential to build assets for all children and deliver effectively and sustainably also matters.

As a “North Star,” future CDA policy should also aim for progressive funding to reduce asset inequality, and multiple developmental uses for asset accumulations (especially education, career development, homeownership, business capitalization, and eventually retirement security). This policy agenda could be accomplished with federal reforms in 529 policy over time. The long-term vision is lifelong and inclusive asset building for all.

This will require policy convergence instead of conflict. Multiple wealth-building concepts and initiatives are quite possible, each with some distinctive purposes. Yet, all can also be delivered on a policy structure that is inclusive, efficient, and effective. The six principles identified in the Urban Institute meeting charts a promising pathway for convergence of early-life wealth-building policies.

Acknowledgments

Support for this publication comes from the Charles Stewart Mott Foundation and an anonymous donor. Major early support for SEED for Oklahoma Kids (SEED OK) came from the Ford Foundation. We express our gratitude to the Urban Institute for hosting a valuable conference and to all attendees; through this gathering, we have collectively developed a broad consensus on policy principles and design features for federal early-life wealth-building policies. We are grateful to Chris Leiker for editorial assistance.
